## VEHICLE DATA-SUPPLEMENT

### DESCRIPTION

**This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual information is in the 2000 Model Year Service Manual.**

**When you are using this information you may be referred to another section of the Service Manual. The refer to is written differently than in prior years.**

## VECI LABEL

### DESCRIPTION

All models have a Vehicle Emission Control Information (VECI) Label. DaimlerChrysler permanently attaches the label in the engine compartment (Fig. 1). It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

The VECI label contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label also contains an engine vacuum schematic. There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages. These labels are permanently attached and cannot be removed without defacing information and destroying label.

## BODY CODE PLATE

### BODY CODE PLATE

A metal body code plate is attached to the floor pan under the drivers seat (Fig. 2). Disengage the snaps attaching the carpet to the floor pan to read the information. There are seven lines of information on the body code plate. Lines 4, 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 3 in the center of the plate to line 1 at the bottom of the plate (Fig. 3).

The last code imprinted on a vehicle code plate will be followed by the imprinted word END. When two vehicle code plates are required, the last available spaces on the first plate will be imprinted with the letters CTD (for continued).

## BODY CODE PLATE (Continued)

**Fig. 2 Body Code Plate Location**

- 1 - SNAP
- 2 - REAR CARPET
- 3 - BODY CODE PLATE
- 4 - SNAP
- 5 - FLOOR PAN
- 6 - FRONT CARPET

When a second vehicle code plate is necessary, the first four spaces on each row will not be used because of the plate overlap.

## Vehicle Identification Number (VIN)

Refer to Vehicle Identification Number (VIN) paragraph for proper breakdown of VIN code.

## VEHICLE IDENTIFICATION NUMBER

## DESCRIPTION

The Vehicle Identification Number (VIN) plate is located on the lower windshield fence near the left A-pillar. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The Vehicle Identification Number is also imprinted on the:

- Vehicle Safety Certification Label.
- Frame rail.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

## VEHICLE IDENTIFICATION NUMBER DECODING CHART

POSITION	INTERPRETATION	CODE = DESCRIPTION
1	Country of Origin	1 = United States
2	Make	J = Jeep
3	Vehicle Type	4 = MPV

LUBRICATION & MAINTENANCE

DESCRIPTION

**This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual information is in the 2000 Model Year Service Manual.**

**When you are using this information you may be referred to another section of the Service Manual. The refer to is written differently than in prior years.**

DESCRIPTION - FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded “regular” gasoline having an octane rating of 87. The routine use of premium gasoline is not recommended. Under normal conditions the use of premium fuel will not provide a benefit over high quality regular gasolines and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

**CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.**

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasolines free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

## LUBRICATION &amp; MAINTENANCE (Continued)

**SULFUR IN GASOLINE**

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

**CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.**

**MATERIALS ADDED TO FUEL**

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

**FUEL SYSTEM CAUTIONS**

**CAUTION: Follow these guidelines to maintain your vehicle's performance:**

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

**NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.**

**SPECIFICATIONS****SPECIFICATIONS - FLUID CAPACITIES**

DESCRIPTION	SPECIFICATION
FUEL TANK	19 U.S. Gallons (71.9 Liters)****
ENGINE OIL	
Engine Oil - with Filter - 2.5L	3.8L (4.0 qts.)
Engine Oil - with Filter - 4.0L	5.7L (6.0 qts.)

Model 216 RBI	1.89L (4.0 pts.)*
* When equipped with Trac-lok®, include 4.0 ounces of Friction Modifier.	
****Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.	

## FLUID TYPES

### DESCRIPTION - ENGINE COOLANT

**WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.**

**CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.**

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.**

### COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

**Pure Water**-Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

**100 percent Ethylene-Glycol**-The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

**50/50 Ethylene-Glycol and Water**-Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to over-heat because specific heat of antifreeze is lower than that of water.

**CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.**

### COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Do not use coolant additives that are claimed to improve engine cooling.**

## FLUID TYPES (Continued)

## DESCRIPTION - ENGINE OIL

**WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.**

## API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

## SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These oils are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation. (Fig. 1)

**Fig. 1 Temperature/Engine Oil Viscosity**

## ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

## CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 2).

9400-9

**Fig. 2 API Symbol**

## MAINTENANCE SCHEDULES

## MAINTENANCE SCHEDULES

There are two maintenance schedules that show proper service for the vehicle.

First is Schedule "A". It lists all the scheduled maintenance to be performed under "normal" operating conditions.

Second is Schedule "B". It is a schedule for vehicles that are operated under the conditions listed at the beginning of that schedule.

Use the schedule that best describes the driving conditions.

Where time and mileage are listed, follow the interval that occurs first.

**At Each Stop For Fuel**

- Check engine oil level, add as required.
- Check windshield washer solvent and add if required.

**Once A Month**

- Check tire pressure and look for unusual wear or damage.
- Inspect battery and clean and tighten terminals as required. Check electrolyte level and add water as needed.
- Check fluid levels of coolant reservoir, power steering, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

**At Each Oil Change**

- Inspect exhaust system.
- Inspect brake hoses.
- Rotate tires.
- Check coolant level, hoses, and clamps.

## MAINTENANCE SCHEDULES (Continued)

- Inspect manual transmission fluid level (if equipped).
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

## Schedule "A"

***7,500 Miles (12 000 km) or at 6 months***

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.

***15,000 Miles (24 000 km) or at 12 months***

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.
- Lubricate steering and suspension ball joints.

***22,500 Miles (36 000 km) or at 18 months***

- Change engine oil.
- Replace engine oil filter.
- Inspect brake linings.
- Lubricate steering linkage joints and outer tie rod ends.

***30,000 Miles (48 000 km) or at 24 months***

- Change engine oil.
- Replace engine oil filter.
- **Replace engine air cleaner element.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Lubricate steering linkage joints and outer tie rod ends.
- Drain and refill transfer case fluid.
- Lubricate steering and suspension ball joints.

***37,500 Miles (60 000 km) or at 30 months***

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.

***45,000 Miles (72 000 km) or at 36 months***

- Change engine oil.
- Replace engine oil filter.
- Inspect brake linings.
- Lubricate steering linkage joints and outer tie rod ends.
- Lubricate steering and suspension ball joints.

***52,500 Miles (84 000 km) or at 42 months***

- Change engine oil.
- Replace engine oil filter.

- Lubricate steering linkage joints and outer tie rod ends.

***60,000 Miles (96 000 km) or at 48 months***

- Change engine oil.
- Replace engine oil filter.
- **Replace engine air cleaner element.**
- **Replace ignition cables (2.5L only).**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Inspect drive belt and replace as needed (4.0L only).
- Lubricate steering linkage joints and outer tie rod ends.
- Drain and refill transfer case fluid.
- Lubricate steering and suspension ball joints.

***67,500 Miles (108 000 km) or at 54 months***

- Change engine oil.
- Replace engine oil filter.
- Inspect brake linings.
- Lubricate steering linkage joints and outer tie rod ends.

***75,000 Miles (120 000 km) or at 60 months***

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.
- Flush and replace engine coolant at 60 months, regardless of mileage.
- Lubricate steering and suspension ball joints.
- Inspect drive belt and replace as needed (4.0L only). Not required if previously replaced.

***82,500 Miles (133 000 km) or at 66 months***

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.

***90,000 Miles (144 000 km) or at 72 months***

- Change engine oil.
- Replace engine oil filter.
- **Replace engine air cleaner element.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Inspect drive belt and replace as needed (4.0L only). Not required if previously replaced.
- Lubricate steering linkage joints and outer tie rod ends.
- Drain and refill transfer case fluid.
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

## MAINTENANCE SCHEDULES (Continued)

**97,500 Miles (156 000 km) or at 78 months**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.

**100,000 Miles (160 000 km)**

- Drain and refill automatic transmission fluid, change filter, and adjust bands.
- Flush and replace engine coolant if not done at 60 months.

**105,000 Miles (168 000 km) or at 84 months**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage joints and outer tie rod ends.
- Lubricate steering and suspension ball joints.
- Inspect drive belt and replace as needed (4.0L only). Not required if previously replaced.

**112,500 Miles (180 000 km) or at 90 months**

- Change engine oil.
- Replace engine oil filter.
- Inspect brake linings.
- Lubricate steering linkage joints and outer tie rod ends.

**120,000 Miles (192 000 km) or at 96 months**

- Change engine oil.
- Replace engine oil filter.
- **Replace engine air cleaner element.**
- **Replace ignition cables (2.5L only).**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Lubricate steering linkage joints and outer tie rod ends.
- Drain and refill transfer case fluid.
- Inspect drive belt and replace as needed (4.0L only). Not required if previously replaced.
- Lubricate steering and suspension ball joints.

**Important:** Inspection and service should also be performed any time a malfunction is observed or suspected.

**Schedule "B"**

Follow this schedule if the vehicle is operated under one or more of the following conditions:

- Day or night temperatures are below 32°F (0°C)
- Stop and go driving
- Extensive engine idling
- Driving in dusty conditions
- Short trips of less than 10 miles (16.2 km)
- More than 50% of driving is at sustained high speeds during hot weather, above 90°F (32°C)

- Trailer towing
- Taxi, Police, or delivery service (commercial service)
- Off-road or desert driving
- If equipped for and operating with E-85 (ethanol) fuel.

**3,000 Miles (5 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**6,000 Miles (10 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**9,000 Miles (14 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**12,000 Miles (19 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**15,000 Miles (24 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace if necessary.**
- Lubricate steering linkage tie rod ends.

**18,000 Miles (29 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**21,000 Miles (34 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**24,000 Miles (38 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

## MAINTENANCE SCHEDULES (Continued)

**27,000 Miles (43 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**30,000 Miles (48 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace if necessary.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Lubricate steering linkage tie rod ends.
- Drain and refill automatic transmission fluid, change filter and adjust bands.
- Drain and refill transfer case fluid.
- Lubricate steering and suspension ball joints.

**33,000 Miles (53 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**36,000 Miles (58 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**39,000 Miles (62 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**42,000 Miles (67 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**45,000 Miles (72 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace if necessary.**
- Lubricate steering linkage tie rod ends.
- Inspect drive belt and replace as needed (4.0L only).

**48,000 Miles (77 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡

- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**51,000 Miles (82 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**54,000 Miles (86 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**57,000 Miles (91 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**60,000 Miles (96 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace as necessary.**
- **Replace ignition cables (2.5L only).**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Inspect drive belt and replace as needed (4.0L only). Not required if belt was previously replaced.
- Lubricate steering linkage tie rod ends.
- Drain and refill transfer case fluid.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.
- Drain and refill automatic transmission fluid, change filter and adjust bands.

**63,000 Miles (101 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**66,000 Miles (106 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**69,000 Miles (110 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**72,000 Miles (115 000 km)**

- Change engine oil.
- Replace engine oil filter.

## MAINTENANCE SCHEDULES (Continued)

- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**75,000 Miles (120 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace as necessary.**
- Lubricate steering linkage tie rod ends.
- Inspect drive belt and replace as needed (4.0L only). Not required if belt was previously replaced.

**78,000 Miles (125 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**81,000 Miles (134 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**84,000 Miles (134 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**87,000 Miles (139 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**90,000 Miles (144 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace as necessary.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Inspect drive belt and replace as needed (4.0L only). Not required if belt was previously replaced.
- Lubricate steering linkage tie rod ends.
- Drain and refill automatic transmission fluid, change filter and adjust bands.
- Drain and refill transfer case fluid.
- Lubricate steering and suspension ball joints.

**93,000 Miles (149 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**96,000 Miles (154 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**99,000 Miles (158 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Flush and replace engine coolant.

**102,000 Miles (163 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**105,000 Miles (168 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace as necessary.**
- Lubricate steering linkage tie rod ends.
- Inspect drive belt and replace as needed (4.0L only). Not required if belt was previously replaced.

**108,000 Miles (173 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Drain and refill front and rear axles.‡
- Inspect brake linings.
- Lubricate steering and suspension ball joints.

**111,000 Miles (178 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

**114,000 Miles (182 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.
- Lubricate steering and suspension ball joints.

**117,000 Miles (187 000 km)**

- Change engine oil.
- Replace engine oil filter.
- Lubricate steering linkage tie rod ends.

## MAINTENANCE SCHEDULES (Continued)

**120,000 Miles (192 000 km)**

- Change engine oil.
- Replace engine oil filter.
- **Inspect engine air cleaner element, replace as necessary.**
- **Replace ignition cables (2.5L only).**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary (2.5L only).
- Inspect drive belt and replace as needed (4.0L only). Not required if previously replaced.
- Lubricate steering linkage tie rod ends.
- Drain and refill automatic transmission fluid, change filter and adjust bands.

- Drain and refill transfer case fluid.
  - Drain and refill front and rear axles.‡
  - Inspect brake linings.
  - Lubricate steering and suspension ball joints.
- ‡Off-highway operation, trailer towing, taxi, limousine, bus, snow plowing, or other types of commercial service or prolonged operation with heavy loading, especially in hot weather, require front and rear axle service indicated with a ‡ in Schedule "B". Perform these services if the vehicle is usually operated under these conditions.

## COOLING

### DESCRIPTION

**This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual information is in the 2000 Model Year Service Manual.**

**When you are using this information you may be referred to another section of the Service Manual. The “Refer to” is written differently than in prior years.**

### DESCRIPTION - 4.0L ENGINE

The cooling system (Fig. 1) is designed to maintain engine temperature at an efficient level during all engine operating conditions.

The components of the cooling system are:

- A heavy duty radiator
- Cooling fan (mechanical)
- Thermal viscous fan drive
- Fan shroud
- Radiator pressure cap
- Thermostat
- Coolant reserve/overflow system
- Automatic transmission oil cooler (internal to radiator)
- Coolant
- Water pump
- Coolant hoses and clamps

80abd2ac

**Fig. 1 Coolant Circulation - 4.0L Engine**

- 1 - FROM THERMOSTAT
- 2 - TO WATER PUMP
- 3 - RADIATOR

## COOLING (Continued)

## OPERATION - HOSE CLAMPS

The worm type hose clamp uses a specified torque value to maintain proper tension on a hose connection.

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, use Special Tool 6094 or equivalent, constant tension clamp pliers (Fig. 2) to compress the hose clamp.

**Fig. 2 Hose Clamp Tool**

2 - HOSE CLAMP

DIAGNOSIS AND TESTING - ON-BOARD  
DIAGNOSTICS (OBD)

## COOLING SYSTEM RELATED DIAGNOSTICS

The Powertrain Control Module (PCM) has been programmed to monitor the certain following cooling system components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicate an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician.

## ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION)

DIAGNOSIS AND TESTING - PRELIMINARY  
CHECKS

## ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- PROLONGED IDLE
- VERY HIGH AMBIENT TEMPERATURE
- SLIGHT TAIL WIND AT IDLE
- SLOW TRAFFIC
- TRAFFIC JAMS
- HIGH SPEED OR STEEP GRADES

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed for more air flow is recommended.

## TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

## AIR CONDITIONING; ADD-ON OR AFTER MARKET:

A maximum cooling package should have been ordered with vehicle if add-on or after market A/C is installed. If not, maximum cooling system components should be installed for model involved per manufacturer's specifications.

## RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

**NOTE:** If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to **COOLING SYSTEM DIAGNOSIS CHART BELOW.**

These charts are to be used as a quick-reference only. Refer to **COOLING SYSTEM DIAGNOSIS CHART**

## COOLING (Continued)

## COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	<ol style="list-style-type: none"> <li>1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?</li> <li>2. Is the temperature sending unit connected?</li> <li>3. Is the temperature gauge operating OK?</li> <li>4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.</li> <li>5. Improper operation of internal heater doors or heater controls.</li> </ol>	<ol style="list-style-type: none"> <li>1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for On-Board Diagnostics and DTC information. Replace thermostat if necessary.</li> <li>2. Check the temperature sensor connector. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATIC - ELECTRICAL) Repair connector if necessary.</li> <li>3. Check gauge operation. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ENGINE TEMPERATURE GAUGE - DESCRIPTION) . Repair as necessary.</li> <li>4. Check coolant level in the coolant reserve/overflow tank and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section of the manual text for WARNINGS and CAUTIONS associated with removing the radiator cap.</li> <li>5. Inspect heater and repair as necessary. (Refer to 24 - HEATING &amp; AIR CONDITIONING - DIAGNOSIS AND TESTING) for procedures.</li> </ol>
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	<ol style="list-style-type: none"> <li>1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.</li> <li>2. Is the temperature gauge reading correctly?</li> </ol>	<ol style="list-style-type: none"> <li>1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. Refer to Possible Causes (2-20).</li> <li>2. Check gauge. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATIC - ELECTRICAL). Repair as necessary.</li> </ol>

## COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	<p>3. Is the temperature warning illuminating unnecessarily?</p> <p>4. Coolant low in coolant reserve/overflow tank and radiator?</p> <p>5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.</p> <p>6. Poor seals at the radiator cap.</p> <p>7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools</p> <p>8. Incorrect coolant concentration</p> <p>9. Coolant not flowing through system</p> <p>10. Radiator or A/C condenser fins are dirty or clogged.</p> <p>11. Radiator core is corroded or plugged.</p> <p>12. Aftermarket A/C installed without proper radiator.</p>	<p>3. (Refer to 8 - ELECTRICAL/ INSTRUMENT CLUSTER - SCHEMATIC - ELECTRICAL).</p> <p>4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>5. Tighten cap</p> <p>6. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.</p> <p>7. (a) Check condition of radiator cap and cap seals. Refer to Radiator Cap in this Group. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. (c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.</p> <p>8. Check coolant. (Refer to LUBRICATION &amp; MAINTENANCE/ FLUID TYPES - DESCRIPTION).</p> <p>9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.</p> <p>10. Remove insects and debris. (Refer to 7 - COOLING - STANDARD PROCEDURE).</p> <p>11. Have radiator re-cored or replaced.</p> <p>12. Install proper radiator.</p>

## COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	<p>13. Fuel or ignition system problems.</p> <p>14. Dragging brakes.</p> <p>15. Bug screen or cardboard is being used, reducing airflow.</p> <p>16. Thermostat partially or completely shut.</p> <p>17. Viscous fan drive not operating properly.</p> <p>18. Cylinder head gasket leaking.</p> <p>19. Heater core leaking.</p>	<p>13. Refer to 14 - Fuel System or 8 - Electrical for diagnosis and testing procedures.</p> <p>14. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) for correct procedures.</p> <p>15. Remove bug screen or cardboard.</p> <p>16. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).</p> <p>17. Check fan drive operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).</p> <p>18. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>19. Check heater core for leaks. (Refer to 24 - HEATING &amp; AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING). Repair as necessary.</p>
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	<p>1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly.</p> <p>2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.</p> <p>3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running)</p> <p>4. Gauge reading high after re-starting a warmed up (hot) engine.</p> <p>5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).</p>	<p>1. A normal condition. No correction is necessary.</p> <p>2. Check operation of gauge and repair if necessary. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).</p> <p>3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.</p> <p>4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.</p> <p>5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p>

## COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	<p>6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.</p> <p>7. Water pump impeller loose on shaft.</p> <p>8. Loose accessory drive belt. (water pump slipping)</p> <p>9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.</p>	<p>6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>(b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.</p> <p>7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).</p> <p>8. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). Check and correct as necessary.</p> <p>9. Locate leak and repair as necessary.</p>
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK	1. Pressure relief valve in radiator cap is defective.	1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	<p>1. Engine overheating.</p> <p>2. Freeze point of coolant not correct. Mixture is too rich or too lean.</p>	<p>1. Check reason for overheating and repair as necessary.</p> <p>2. Check coolant concentration. (Refer to LUBRICATION &amp; MAINTENANCE/FLUID TYPES - DESCRIPTION).</p>
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	<p>1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace if necessary</p> <p>(b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary.</p>

## COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
		<p>(c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary.</p> <p>(d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.</p>
NOISY VISCOUS FAN/DRIVE	<ol style="list-style-type: none"> <li>1. Fan blades loose.</li> <li>2. Fan blades striking a surrounding object.</li> <li>3. Air obstructions at radiator or air conditioning condenser.</li> <li>4. Thermal viscous fan drive has defective bearing.</li> <li>5. A certain amount of fan noise may be evident on models equipped with a thermal viscous fan drive. Some of this noise is normal.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace fan blade assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)</li> <li>2. Locate point of fan blade contact and repair as necessary.</li> <li>3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser.</li> <li>4. Replace fan drive. Bearing is not serviceable. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).</li> <li>5. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DESCRIPTION) for an explanation of normal fan noise.</li> </ol>
INADEQUATE HEATER PERFORMANCE. THERMOSTAT FAILED IN OPEN POSITION	<ol style="list-style-type: none"> <li>1. Has a Diagnostic trouble Code (DTC) been set?</li> <li>2. Coolant level low</li> <li>3. Obstructions in heater hose/fittings</li> <li>4. Heater hose kinked</li> <li>5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.</li> </ol>	<ol style="list-style-type: none"> <li>1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for correct procedures and replace thermostat if necessary</li> <li>2. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</li> <li>3. Remove heater hoses at both ends and check for obstructions</li> <li>4. Locate kinked area and repair as necessary</li> <li>5. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL). If a slipping belt is detected, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). If heater core obstruction is detected, (Refer to 24 - HEATING &amp; AIR CONDITIONING/PLUMBING/HEATER CORE - REMOVAL).</li> </ol>

## COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

**STANDARD PROCEDURE - COOLING SYSTEM - REVERSE FLUSHING**

**CAUTION:** The cooling system normally operates at 97-to-124 kPa (14- to-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

**CHEMICAL CLEANING**

If visual inspection indicates the formation of sludge or scaly deposits, use a radiator cleaner (Mopar Radiator Klean or equivalent) before flushing. This will soften scale and other deposits and aid the flushing operation.

**CAUTION:** Be sure instructions on the container are followed.

**REVERSE FLUSHING RADIATOR**

Disconnect the radiator hoses from the radiator fittings. Attach a section of radiator hose to the radiator

bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

**CAUTION:** The cooling system normally operates at 97-to-124 kPa (14- to-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Allow the radiator to fill with water. When radiator is filled, apply air in short blasts allowing radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. For more information, refer to operating instructions supplied with flushing equipment. Have radiator cleaned more extensively by a radiator repair shop.

**REVERSE FLUSHING ENGINE**

Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump. Attach a lead away hose to the water pump inlet fitting.

## COOLING (Continued)

**CAUTION:** Be sure that the heater control valve is closed (heat off). This is done to prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to the flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose. For more information, refer to operating instructions supplied with flushing equipment.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Install the thermostat and housing with a replacement gasket (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION). Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture (Refer to 7 - COOLING - STANDARD PROCEDURE).

## ACCESSORY DRIVE

### TABLE OF CONTENTS

	page		page
<b>BELT TENSIONERS - 2.5L</b>		<b>REMOVAL</b> .....	11
REMOVAL .....	10	<b>INSTALLATION</b> .....	11
INSTALLATION .....	10		
<b>BELT TENSIONERS - 4.0L</b>			
DESCRIPTION .....	10		

### BELT TENSIONERS - 2.5L

#### REMOVAL

(1) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove the pulley bolt, bushing, pulley and spacer (Fig. 1).

(3) Remove the tensioner adjustment bolt and tensioner collar (Fig. 1).

#### INSTALLATION

(1) Position tensioner collar and install the tensioner adjustment bolt.

(2) Position the spacer, idler pulley, bushing and bolt.

(3) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

### BELT TENSIONERS - 4.0L

#### DESCRIPTION

The automatic belt tensioner (Fig. 2) is a spring loaded arm and pulley assembly. The tensioner assembly is designed to apply constant pressure on the accessory drive belt to maintain proper belt tension. There are three marks on the tensioner body, these marks are there to indicate belt wear and belt tension.

80bc4d0e

**Fig. 1 Accessory Drive Belt Tensioner - 2.5L Engine**

- 1 - TENSIONER BRACKET
- 2 - TENSIONER COLLAR
- 3 - SPACER
- 4 - BUSHING
- 5 - BOLT
- 6 - IDLER PULLEY
- 7 - TENSIONER ADJUSTMENT BOLT

**NOTE:** On 4.0L engines, the tensioner arm has three marks. Upon installation of a new belt, the double line marks close to each other should be very close to the mark on the base. The belt should be replaced if the single line mark lines up with the mark on the base.

## BELT TENSIONERS - 4.0L (Continued)

80bc4d20

**Fig. 2 Accessory Drive Belt Wear Indicator - 4.0L Engine**

- 1 - INDICATOR MARK  
2 - MINIMUM TENSION MARK  
3 - MAXIMUM TENSION MARK

## REMOVAL

On 4.0L engines, the tensioner arm has three marks. Upon installation of a new belt, the double line marks close to each other should be very close to the mark on the base. The belt should be replaced if the single line mark lines up with the mark on the base.

If the above specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

**NOTE:** A used belt should be replaced if tensioner indexing arrow has moved to the minimum travel indicator. Tensioner travel stops at this point.

(1) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove tensioner assembly from mounting bracket (Fig. 3).

80ba7813

**Fig. 3 Automatic Belt Tensioner - 4.0L Engine**

- 1 - IDLER PULLEY TIGHTEN TO 47 N·m (35 FT. LBS.)  
2 - AUTOMATIC BELT TENSIONER  
3 - GENERATOR MOUNTING BRACKET

**WARNING:** BECAUSE OF HIGH SPRING TENSION, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY.

## INSTALLATION

(1) Install tensioner assembly to mounting bracket, align the two dowels on the tensioner with the mounting bracket and hand start the bolt. Tighten bolt to 28 N·m (250 in. lbs.).

(2) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(3) Check belt indexing marks.

## ENGINE COOLANT TEMP SENSOR

## DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

## OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- For engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

## ENGINE COOLANT TEMP SENSOR (Continued)

**REMOVAL**

**WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.**

The coolant temperature sensor is installed in the thermostat housing (Fig. 2).

80a871b7

**Fig. 2 Engine Coolant Temperature Sensor - Typical**

- 1 - THERMOSTAT HOUSING
- 2 - ENGINE COOLANT TEMPERATURE SENSOR
- 3 - ELECTRICAL CONNECTOR

(1) Partially drain cooling system until coolant level is below cylinder head. (Refer to 7 - COOLING - STANDARD PROCEDURE).

(2) Disconnect coolant temperature sensor wire connector.

(3) Remove sensor from thermostat housing.

**INSTALLATION**

(1) Apply sealant to sensor threads (new replacement sensors will have sealant already applied).

(2) Install coolant temperature sensor into thermostat housing. Tighten to 11 N·m (8 ft. lbs.) torque.

(3) Connect wire connector.

(4) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).

# TRANSMISSION

## TABLE OF CONTENTS

	page	page
<b>TRANS COOLER</b>		
STANDARD PROCEDURE . . . . .	14	
		<b>FLUSHING COOLERS AND TUBES . . . . . 14</b>

## TRANS COOLER

### STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906-B Cooler Flusher.

#### WARNING:

**WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1-1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES. KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.**

**KEEP THE AREA WELL VENTILATED.**

**DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.**

(1) Remove cover plate filler plug on Tool 6906-B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906-B.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

**NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.**

**NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.**

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Turn pump ON for two to three minutes to flush cooler(s) and lines.

(8) Turn pump OFF.

(9) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(10) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(11) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(12) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(13) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

### DESCRIPTION

**This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual information is in the 2000 Model Year Service Manual.**

**When you are using this information you may be referred to another section of the Service Manual. The “Refer to” is written differently than in prior years.**

## AMPLIFIED SUBWOOFER

### DESCRIPTION

The available amplified subwoofer is mounted within the center console. The amplified subwoofer is rated at 40 watts per channel. The amplified subwoofer should be checked if there is no bass output noted from the rear speakers. The amplified subwoofer can not be repaired or adjusted, and if faulty or damaged, the unit must be replaced.

### OPERATION

The amplified subwoofer receives fused current from the Radio Choke Relay. The amplified subwoofer provides low frequency bass and receives inputs from the rear speaker circuits.

### DIAGNOSIS AND TESTING - AMPLIFIED SUBWOOFER

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector

repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**CAUTION:** The speaker output of the radio is a “floating ground” system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

- (1) Turn the ignition switch to the On position. Turn the radio receiver on. Adjust the balance and fader controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly.
- (2) Disconnect the wire harness connector from the amplified subwoofer. Turn the ignition switch to the ON position. Turn the radio ON. Check the battery feed and ground cavities in the wire harness connector. Check the radio choke relay wire harness connector. If not OK, repair shorted or open wires as necessary. If OK, go to (STEP #3).
- (3) Turn the radio receiver off. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the radio receiver and the amplified subwoofer. Check both the speaker feed (+) circuit and return (–) circuit cavities for the

## AMPLIFIED SUBWOOFER (Continued)

inoperative speaker location(s) from the radio receiver wire harness connectors and to the amplified subwoofer for continuity. In each case, there should be continuity. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required. If OK, replace the amplified subwoofer.

## REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the center console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).
- (3) Disconnect wire harness retainer.
- (4) Disconnect wire harness connector.
- (5) Remove the mounting screws from the side of the console.
- (6) Open console lid and remove the retaining fasteners from the console.
- (7) Remove amplified subwoofer from console.

## INSTALLATION

- (1) Install amplified subwoofer to console.
- (2) Install retaining fasteners to the top of the console.
- (3) Install the mounting screws to the side of the console.
- (4) Connect wire harness connector and retainer.
- (5) Install the center console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).
- (6) Connect the battery negative cable.

## ANTENNA BODY &amp; CABLE

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, (REFER TO ELECTRICAL/RESTRAINTS) BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
- (3) Reach through the instrument panel glove box opening to unplug the antenna coaxial cable connector. Unplug the connector by pulling it apart while twisting the metal connector halves. Do not pull on the cable.

- (4) Unscrew the antenna mast from the antenna body base on the right outer cowl side panel (Fig. 1).

**Fig. 1 Antenna Remove/Install**

- 1 - RIGHT COWL SIDE PANEL
- 2 - BASE & CABLE
- 3 - GROMMET
- 4 - SCREW
- 5 - COVER
- 6 - MAST

- (5) Using a trim stick or another suitable wide flat-bladed tool, gently pry the edge of the antenna base trim cover to unsnap it from the antenna body base.

- (6) Remove the three screws that secure the antenna body base to the right outer cowl side panel.

- (7) From inside the passenger compartment, push the coaxial cable grommet on the antenna body half of the coaxial cable out through the hole in the right inner cowl side panel.

- (8) From the outside of the vehicle, pull the antenna body base and cable assembly out through the hole in the right outer cowl side panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, (REFER TO ELECTRICAL/RESTRAINTS) BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## ANTENNA BODY & CABLE (Continued)

- (1) From outside the vehicle, feed the antenna cable and base assembly through the outer cowl side panel.
- (2) From inside the passenger compartment, pull the cable and grommet into the hole in the inside cowl side panel until the grommet is seated.
- (3) Install the three screws retaining the antenna body base to right outer cowl side panel. Tighten the screws to 3.3 N·m (30 in. lbs.).
- (4) Screw the antenna mast to the antenna body base.
- (5) Reach through the glove box opening and secure the antenna coaxial cable the radio antenna port.
- (6) Install the glove box to the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
- (7) Connect the battery negative cable.

## RADIO

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, (REFER TO ELECTRICAL/RESTRAINTS) BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the instrument panel top cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
- (3) Remove the ash receiver from the ash receiver housing in the lower instrument panel center bezel.
- (4) Remove the one screw located in the back of the ash receiver housing that secures the center bezel to the lower instrument panel (Fig. 2).
- (5) Remove the two screws that secure the center bezel to the top of the instrument panel.
- (6) Using a trim stick or another suitable wide flat-bladed tool, gently pry the lower edge of the center bezel away from the instrument panel.
- (7) Lift the lower edge of the center bezel upwards to release the four snap clip retainers that secure it to the instrument panel.
- (8) Remove the center bezel from the instrument panel.
- (9) Remove the two screws that secure the radio to the instrument panel (Fig. 3).

**Fig. 2 Center Bezel Remove/Install**

(10) If the vehicle is equipped with the CD radio receiver, go to Step 11. If the vehicle is not equipped with the CD radio receiver, go to Step 13.

(11) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

## RADIO (Continued)

(12) Reach through the instrument panel glove box opening to access and remove the screw that secures the CD radio bracket and the ground strap to the back of the radio receiver chassis (Fig. 4).

(13) Pull the radio out from the instrument panel far enough to access the wire harness connectors and the antenna coaxial cable connector (Fig. 4).

**Fig. 4 Radio Connections - Typical**

- 1 - RADIO RECEIVER
- 2 - INSTRUMENT PANEL WIRE HARNESS
- 3 - CD RADIO BRACKET
- 4 - SCREW
- 5 - GROUND STRAP
- 6 - ANTENNA CABLE

(14) Unplug the wire harness connectors and the antenna coaxial cable connector from the rear of the radio.

(15) If the vehicle is not equipped with the CD radio receiver, remove the screw that secures the ground strap to the back of the radio receiver chassis.

(16) Remove the radio from the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, (REFER TO ELECTRICAL/RESTRAINTS) BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Position the radio into the instrument panel.
- (2) Install the screw that secures the ground strap to the back of the radio receiver chassis.
- (3) Connect the coaxial antenna cable at the rear of the radio chassis.

(4) Connect the radio wire harness connectors to the rear of the radio.

(5) Install the two radio retaining screws. Tighten the screws to 5 N·m (20 in. lbs).

(6) Install the center bezel to the instrument panel. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(7) Install the one screw located at the back of the ash receiver housing that secures the center bezel to the lower instrument panel.

(8) Install the ash receiver.

(9) Connect the battery negative cable.

## SPEAKER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the two screws that secure the out-board end of the speaker bezel to the instrument panel (Fig. 5).

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the top and bottom edges of the speaker bezel to release the two snap clip retainers that secure the bezel to the instrument panel.

(4) Remove the speaker bezel from the instrument panel.

(5) Remove the four screws that secure the speaker to the instrument panel armature (Fig. 6).

(6) Pull the speaker away from the instrument panel far enough to access the speaker wire harness connector.

(7) Unplug the wire harness connector from the speaker.

(8) Remove the speaker from the instrument panel.

## SPEAKER (Continued)

**Fig. 5 Instrument Panel Speaker Bezel Remove/Install**

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, (REFER TO ELECTRICAL/RESTRAINTS) BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Connect the speaker wire connector to the speaker.
- (2) Position the speaker to the instrument panel.
- (3) Install the four speaker retaining screws. Tighten the screws to 1.1 N·m (10.in.lbs).
- (4) Install the speaker bezel to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (5) Connect the battery negative cable.

## SOUND BAR

## REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) If the vehicle is equipped with the optional hard top, remove the hard top from the vehicle. (Refer to 23 - BODY/REMOVEABLE TOP/TOP - REMOVAL).
- (3) If the vehicle is equipped with the standard soft top, lower the soft top. Refer to Folding Down the Fabric Top in the Owner's Manual for the procedures.
- (4) Release the hook and loop closure on each outboard end flap of the sound bar trim cover.
- (5) Lift the left outboard end flap of the sound bar trim cover over the top of the sport bar far enough to access the wire harness connector (Fig. 7).

**Fig. 7 Sound Bar Wire Harness Connector Remove/Install**

- 1 - SPORT BAR
- 2 - SOUND BAR
- 3 - CONNECTOR

## SOUND BAR (Continued)

- (6) Unplug the sound bar wire harness connector.
- (7) Lift each outboard end flap of the sound bar cover over the top of the sport bar far enough to access the mounting screws (Fig. 8).
- (8) Remove the two screws that secure each end of the sound bar to the sport bar.
- (9) Lift the sound bar up off of the sport bar to remove it from the vehicle.

**INSTALLATION**

- (1) Position the sound bar onto the sport bar.
- (2) Install the two screws retaining the sound bar to the sport bar.
- (3) Connect the sound bar wire harness connector.
- (4) Position the sound bar trim cover and attach the hook and loop.
- (5) If the vehicle is equipped with the standard soft top, raise the soft top.
- (6) If the vehicle is equipped with the optional hard top, install the hard top (Refer to 23 - BODY/REMOVEABLE TOP/TOP - INSTALLATION).
- (7) Connect the battery negative cable.

## INSTRUMENT CLUSTER

### DESCRIPTION

This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual

information is in the 2000 Model Year Service Manual.

When you are using this information you may be referred to another section of the Service Manual. The "Refer to" is written differently than in prior years.

## INSTRUMENT CLUSTER (Continued)

## DESCRIPTION

**Fig. 1 Instrument Cluster**

- 1 - CLUSTER BEZEL  
2 - INSTRUMENT CLUSTER

The instrument cluster for this model is an ElectroMechanical Instrument Cluster (EMIC) module that is located in the instrument panel above the steering column opening, directly in front of the driver (Fig. 1). The EMIC gauges and indicators are protected by an integral clear plastic cluster lens, and are visible through a dedicated opening in the cluster bezel on the instrument panel. Just behind the cluster lens is the cluster hood and integral cluster mask, which are constructed of molded black plastic. The cluster hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare, while the cluster mask trims the outside perimeter of the cluster overlay. Behind the cluster hood and mask is the cluster overlay and gauges. The overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the gauge identification and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the various indicators and illumination lamps behind it to be visible through the outer layer of the mask only through predetermined stencil-like cutouts. On the lower edge of the cluster lens just right of center, a small molded rubber odometer/trip odometer switch knob boot covers the switch knob and seals the hole in the lens through which the knob protrudes. The remainder of the EMIC, including the mounts and the electrical connections, are concealed behind the

cluster bezel. The molded plastic EMIC housing has four integral mounting tabs, two on the lower edge of the housing and one on each side. The EMIC is secured to the instrument panel structural support with four screws. All electrical connections to the EMIC are made at the back of the cluster housing through two color-coded connector receptacles that connect the cluster to the vehicle electrical system through two take outs and connectors of the instrument panel wire harness.

A single EMIC module is offered on this model; however, some variations of this module exist due to optional equipment and regulatory requirements. This module utilizes integrated circuitry and information carried on the Programmable Communications Interface (PCI) data bus network for control of all gauges and many of the indicators. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION). The EMIC also uses several hard wired inputs in order to perform its many functions. In addition to instrumentation and indicators, the EMIC has hardware and/or software to support the following functions:

- **Chime Warning Service** - The EMIC performs the functions necessary to provide audible alerts to the vehicle operator and eliminates the need for a separate chime module. (Refer to 8 - ELECTRICAL/CHIME/BUZZER - DESCRIPTION).

- **Interior Lighting Control Service** - The EMIC performs the functions necessary to provide control of the interior lighting. This control includes providing illuminated entry, fade-to-off (theater) dimming, and battery saver (load shedding) features for all interior courtesy lighting.

- **Rear Window Defogger Control and Timer Service** - The EMIC performs the functions necessary to control and time the output to the rear window defogger on vehicles so equipped and eliminates the need for a separate control and timer module for the rear window defogger system. (Refer to 8 - ELECTRICAL/WINDOW DEFOGGER - DESCRIPTION).

- **Vacuum Fluorescent Display (VFD) and Panel Lamps Dimming Service** - The EMIC performs the functions necessary to eliminate the need for a separate dimming module. The cluster converts an analog input signal from the headlamp and panel lamps dimmer switches to the appropriate digital, pulse-width modulated outputs to control the dimming levels of both the instrument cluster and radio VFDs as well as the incandescent cluster and panel illumination lighting. This includes providing features such as VFD illumination when a door is ajar, radio illumination control, a parade mode, and dimmable cruise, four-wheel drive, and upshift indicators.

## INSTRUMENT CLUSTER (Continued)

The EMIC module incorporates a blue-green electronic digital VFD for displaying odometer, trip odometer, and diagnostic information. The EMIC includes the following analog gauges:

- **Coolant Temperature Gauge**
- **Fuel Gauge**
- **Oil Pressure Gauge**
- **Speedometer**
- **Tachometer**
- **Voltage Gauge**

The EMIC also includes provisions for the following indicators:

- **Airbag Indicator**
- **Antilock Brake System (ABS) Indicator**
- **Brake Indicator**
- **Check Gauges Indicator**
- **Cruise Indicator**
- **Fog Lamp (Front or Rear) Indicator**
- **Four-Wheel Drive (Part Time and/or Full Time) Indicator**
- **High Beam Indicator**
- **Low Fuel Indicator**
- **Malfunction Indicator Lamp (MIL)**
- **Seatbelt Indicator**
- **Sentry Key Immobilizer System (SKIS) Indicator**
- **Turn Signal (Right and Left) Indicators**
- **Upshift Indicator (Manual Transmission)**

Some of these indicators are automatically configured when the EMIC is connected to the vehicle electrical system. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. The EMIC uses electronic messages received over the PCI data bus from the Airbag Control Module (ACM), the Sentry Key Immobilizer Module (SKIM), and the Powertrain Control Module (PCM) to learn whether the vehicle is equipped with airbags, the Sentry Key Immobilizer System (SKIS), or cruise control; then, configures the appropriate indicators accordingly. Once the EMIC learns that a vehicle has these equipment options installed, these indicators will function accordingly for the remainder of the cluster life.

Cluster illumination is accomplished by adjustable incandescent back lighting, which illuminates the gauges for visibility when the exterior lighting is turned on. The EMIC high beam indicator is illuminated by a dedicated incandescent bulb. The remaining indicators in the EMIC are each illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the electronic circuit board. Each of the incandescent bulbs is secured by an integral bulb holder to the electronic circuit board from the back of the cluster housing.

Hard wired circuitry connects the EMIC to the electrical system of the vehicle. These hard wired cir-

cuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC modules for this model are serviced only as complete units. The EMIC module cannot be adjusted or repaired. If a gauge, an LED indicator, the VFD, the electronic circuit board, the circuit board hardware, the cluster overlay, or the EMIC housing are damaged or faulty, the entire EMIC module must be replaced. The cluster lens, the cluster hood and mask unit, the rear cluster housing cover, the odometer/trip odometer switch knob boot, and the incandescent lamp bulbs with holders are available for individual service replacement.

## OPERATION

The ElectroMechanical Instrument Cluster (EMIC) is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the EMIC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems, and many other convenience items. The EMIC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service. The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Programmable Commutations Interface (PCI) data bus network. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable, and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist, such as low/high battery voltage, low oil pressure, or high coolant temperature, the algorithm drives the gauge pointer to an

## INSTRUMENT CLUSTER (Continued)

extreme position and the microprocessor turns on the Check Gauges indicator to provide a distinct visual indication of a problem to the vehicle operator. The instrument cluster circuitry may also generate a chime tone when it monitors certain conditions or inputs to provide the vehicle operator with an audible alert.

The EMIC circuitry operates on battery current received through the Ignition-Off Draw (IOD) fuse in the Power Distribution Center (PDC) on a non-switched fused B(+) circuit, and on battery current received through a fuse in the fuse block on a fused ignition switch output (run-start) circuit. This arrangement allows the EMIC to provide chime service and interior lighting control regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The EMIC circuitry is grounded by a single ground circuit through one of the instrument cluster connectors and take outs of the instrument panel wire harness. This ground circuit receives ground through a single wire take out with an eyelet terminal connector that is secured under a ground screw to the back of the instrument panel structural support near the lower left corner of the instrument panel, just inboard of the left instrument panel end bracket.

The EMIC also has a self-diagnostic actuator test capability, which will test each of the PCI bus message-controlled functions of the cluster by lighting the appropriate indicator lamps and positioning the gauge needles at several predetermined locations on the gauge faces in a prescribed sequence. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). See the owner's manual in the vehicle glove box for more information on the features, use and operation of the EMIC.

### GAUGES

All gauges receive battery current through the EMIC circuitry when the ignition switch is in the On or Start positions. With the ignition switch in the Off position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions. All of the EMIC gauges, except the odometer, are air core magnetic units. Two fixed electromagnetic coils are located within each gauge. These coils are wrapped at right angles to each other around a movable permanent magnet. The movable magnet is suspended within the coils on one end of a pivot shaft, while the gauge needle is attached to the other end of the shaft. One of the coils has a fixed current flowing

through it to maintain a constant magnetic field strength. Current flow through the second coil changes, which causes changes in its magnetic field strength. The current flowing through the second coil is changed by the EMIC circuitry in response to messages received over the PCI data bus. The gauge needle moves as the movable permanent magnet aligns itself to the changing magnetic fields created around it by the electromagnets.

The gauges are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the PCI data bus and the data bus message inputs to the EMIC that control each gauge require the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

### VACUUM-FLUORESCENT DISPLAY

The Vacuum-Fluorescent Display (VFD) module is soldered to the EMIC electronic circuit board. The display is active when either door is opened or with the ignition switch in the On or Start positions, and inactive about twenty seconds after both doors are closed when the ignition switch is in any other position. If a door is left open with ignition switch in any position except On or Start, the VFD will remain illuminated until the interior lights control battery saver (load shedding) timer expires after about twenty minutes. The VFD has several display capabilities including: odometer, trip odometer, software version display, and can display various diagnostic information. An odometer/trip odometer switch on the EMIC circuit board is used to control several of the display modes. This switch is actuated manually by depressing the odometer/trip odometer switch knob that extends through the lower edge of the cluster lens, just right of center. Actuating this switch momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer modes. Depressing the switch button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. Holding this switch depressed while turning the ignition switch from the Off position to the On position will activate the EMIC self-diagnostic actuator test. When illuminated, the VFD will automatically display the message "no BuS" in place of the odometer or trip odometer information if there is a loss of PCI data bus communication, and will display the message "noFuSE" if the instrument cluster is not receiving battery current through the fused B(+) circuit from the Ignition-Off Draw (IOD) fuse. The VFD will also display various information used in several diagnostic procedures. Refer to the appropriate diagnostic

## INSTRUMENT CLUSTER (Continued)

information for additional details on these VFD functions.

The VFD is diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the PCI data bus and the data bus message inputs to the EMIC that control some of the VFD functions requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer and trip odometer functions of the VFD may be found elsewhere in this service information.

### INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC electronic circuit board. The antilock brake system indicator, four-wheel drive indicators, headlamp high beam indicator, front/rear fog lamp indicator, and turn signal indicators are hard wired. The brake indicator is controlled by the hard wired park brake/brake warning indicator switch input to the EMIC and the EMIC programming. The seatbelt indicator is controlled by the hard wired seat belt switch input to the EMIC and the EMIC programming. The Malfunction Indicator Lamp (MIL) is normally controlled by PCI data bus messages from the Powertrain Control Module (PCM); however, if the EMIC loses PCI data bus communications, the EMIC circuitry will automatically turn the MIL on and display the message "no BuS" in the odometer VFD until PCI data bus communication is restored. The EMIC uses PCI data bus messages from the PCM, Airbag Control Module (ACM), and the Sentry Key Immobilizer Module (SKIM) to control all of the remaining indicators. Different indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry and have a switched ground, while others are grounded through the EMIC circuitry and have a switched battery feed.

In addition, certain indicators in this instrument cluster are configurable. This feature allows these indicators to be automatically enabled or disabled by the EMIC circuitry for compatibility with certain optional equipment. The airbag indicator, cruise indicator, and the Sentry Key Immobilizer System (SKIS) indicator are automatically configured. Once a configurable indicator is enabled by the EMIC, it is learned and stored in cluster memory for the remainder of the cluster life.

The hard wired indicators are diagnosed using conventional diagnostic methods. The EMIC and PCI bus message controlled indicators are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the

PCI data bus and the data bus message inputs to the EMIC that control each indicator requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. Specific operation details for each indicator may be found elsewhere in this service information.

### CLUSTER ILLUMINATION

The EMIC has several illumination lamps that are illuminated when the exterior lighting is turned on with the headlamp switch circuitry of the left multi-function switch. The illumination brightness of these lamps is adjusted by the panel lamps dimmer rheostat when the control ring on the left multi-function switch control stalk is rotated (downward to dim, upward to brighten). An analog/digital (A/D) converter in the EMIC converts the analog panel lamps dimmer rheostat input from the left multi-function switch to a digital dimming level pulse-width modulated signal for controlling the lighting levels of the EMIC VFD and cluster illumination lamps. The EMIC also controls and synchronizes the radio and other instrument panel lighting levels through a hard wired panel lamp feed output circuit.

The hard wired cluster illumination inputs and outputs are diagnosed using conventional diagnostic methods. Proper testing of the VFD dimming level and the EMIC A/D converter function require the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

### CHIME SERVICE

The EMIC is equipped with hardware and software to provide chime service for all available features in the chime warning system. Upon receiving the proper chime inputs, the EMIC activates an integral chime tone generator to provide the audible chime tone to the vehicle operator. The chime tone generator in the EMIC is capable of producing single chime tones or repeated chime tones at two different rates: a slow rate of about fifty chime tones per minute, and a fast rate of about 180 chime tones per minute. The internal programming of the EMIC determines the priority of each chime tone request input that is received, as well as the rate and duration of each chime tone that is to be generated.

The EMIC relies upon hard wired inputs from the door ajar switches, the left multi-function switch, the ignition switch, and the park brake/brake warning indicator switches to provide chime service for the driver/passenger door ajar warning, the head/park lights-on reminder, and the key-in ignition reminder. For the remaining chime warning functions the EMIC uses a combination of hard wired inputs, electronic message inputs received from other modules over the PCI data bus, and internal programming.

## INSTRUMENT CLUSTER (Continued)

(Refer to 8 - ELECTRICAL/CHIME/BUZZER - OPERATION). The hard wired chime inputs to the EMIC are diagnosed using conventional diagnostic methods. Proper testing of the EMIC, its programming, and the PCI data bus chime request message functions requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

## INTERIOR LIGHTING CONTROL

The EMIC contains an integral timer and logic circuit to perform both timer and control functions for the interior courtesy lamps. The EMIC uses hard wired inputs from the ignition switch, both door ajar switches on separate driver and passenger door ajar switch sense circuits, from the resistor multiplexed panel lamps dimmer circuitry of the left multi-function switch on the panel lamps dimmer signal circuit and its control logic to provide a battery current output to the courtesy lamps on a courtesy lamp feed circuit. The EMIC control provides a theater-type fade-to-off feature that will slowly dim the courtesy lamps about five seconds after both doors are closed. The EMIC also provides an illuminated entry/exit feature by monitoring the door ajar and ignition switch inputs. When a door is opened with the ignition switch in the Off position, the EMIC turns on the courtesy lamps. When the ignition switch is turned to the On or Start positions, the EMIC turns the courtesy lamps off immediately with no theater dimming. When the ignition switch is turned from the On position to the Off position, the EMIC turns on the interior lights for about ten seconds or until the ignition switch is again turned to the On or Start positions, whichever occurs first. The EMIC also provides a battery saver feature (load shedding) for the interior lighting. Unless the engine is running, the instrument cluster will automatically turn off the interior lights if they are left on for more than about twenty minutes, regardless of the status of the ignition switch, door ajar switch, or left multi-function switch inputs to the cluster.

The hard wired inputs and output of the EMIC interior lighting control can be diagnosed using conventional diagnostic methods; however, there are no other diagnostic tools available for the EMIC timer and logic circuitry. If the input and output components and circuits of the interior lighting system test OK, but the system fails to operate, the EMIC must be replaced.

## REAR WINDOW DEFOGGER CONTROL

The EMIC contains an integral timer and logic circuit to perform the rear window defogger timer and control functions for the optional rear window defogger system. The EMIC uses a hard wired input from the rear window defogger switch on the rear window

defogger switch sense circuit and its control logic to determine the correct output to the rear window defogger relay. The EMIC controls the ground path of the rear window defogger relay control coil through an output on the rear window defogger relay control circuit. The EMIC is programmed to interpret each momentary ground signal it receives on the rear window defogger switch sense circuit as a request to change the current state of the output on the rear window defogger relay control circuit. Therefore, with the ignition switch in the On position, the first ground input on the rear window defogger switch sense circuit turns the system On, the second ground input turns the system Off, and so forth. Once the rear window defogger system has been turned On, it can be turned off manually by depressing the rear window defogger switch a second time or by turning the ignition switch to the Off position. The timer function of the EMIC will also automatically turn the rear window defogger system Off. The timer turns the system Off after about ten minutes of operation; however, after the first timed interval has expired, each time the system is turned On again during that same ignition cycle, the timer will automatically turn it Off after about five minutes of operation.

The hard wired input and output of the EMIC rear window defogger control can be diagnosed using conventional diagnostic methods; however, there are no other diagnostic tools available for the EMIC rear window defogger timer and logic circuitry. If the input and output components and circuits of the rear window defogger system test OK, but the system fails to operate, the EMIC must be replaced.

## DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

If all of the instrument cluster gauges and/or indicators are inoperative, refer to PRELIMINARY DIAGNOSIS . If an individual gauge or Programmable Communications Interface (PCI) data bus message-controlled indicator is inoperative, refer to ACTUATOR TEST . If an individual hard wired indicator is inoperative, refer to the diagnosis and testing information for that specific indicator. If the instrument cluster chime service is inoperative, refer to CHIME SERVICE DIAGNOSIS . If the instrument cluster illumination lighting is inoperative, refer to CLUSTER ILLUMINATION DIAGNOSIS . If the instrument cluster interior lighting control function is inoperative, refer to INTERIOR LIGHTING CONTROL DIAGNOSIS . If the instrument cluster rear window defogger control function is inoperative, refer to REAR WINDOW DEFOGGER CONTROL DIAGNOSIS . Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details

## INSTRUMENT CLUSTER (Continued)

of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**NOTE:** Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated for compatibility with certain optional equipment. If the problem being diagnosed involves illumination of the airbag indicator, the cruise indicator, or the SKIM indicator when the vehicle does not have this equipment, the instrument cluster must be replaced with a new unit.

## PRELIMINARY DIAGNOSIS

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) If the indicators operate, but none of the gauges operate, go to Step 2. If all of the gauges and the PCI data bus message-controlled indicators are inoperative, go to Step 5.

(2) Check the fused B(+) fuse (Fuse 24 - 10 ampere) in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(3) Check for battery voltage at the fused B(+) fuse (Fuse 24 - 10 ampere) in the PDC. If OK, go to Step 4. If not OK, repair the open B(+) circuit between the PDC and the battery as required.

(4) Disconnect and isolate the battery negative cable. Remove the instrument cluster. Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. If OK, refer to ACTUATOR TEST . If not OK, repair the open fused B(+) circuit between the instrument cluster and the PDC as required.

(5) Check the fused ignition switch output (run-start) fuse (Fuse 10 - 10 ampere) in the fuse block. If OK, go to Step 6. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(6) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-start) fuse (Fuse 10 - 10 ampere) in the fuse block. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (run-start) circuit between the fuse block and the ignition switch as required.

(7) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Reinstall the instrument cluster. Reconnect the battery negative cable. Turn the ignition switch to the On position. Set the park brake. The brake indicator in the instrument cluster should light. If OK, go to Step 8. If not OK, go to Step 9.

(8) Turn the ignition switch to the Off position. Turn on the park lamps and adjust the panel lamps dimmer control ring on the left multi-function switch to the full bright position. The cluster illumination lamps should light. If OK, refer to ACTUATOR TEST . If not OK, go to Step 10.

(9) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-start) circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. If OK, refer to ACTUATOR TEST . If not OK, repair the open fused ignition switch output (run-start) circuit between the instrument cluster and the fuse block as required.

(10) Disconnect and isolate the battery negative cable. Remove the instrument cluster. Check for continuity between the ground circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster and a good ground. There should be continuity. If OK, refer to ACTUATOR TEST . If not OK, repair the open ground circuit to ground (G201) as required.

## ACTUATOR TEST

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## INSTRUMENT CLUSTER (Continued)

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, the PCI data bus message controlled indicator lamps, and the chime tone generator are capable of operating as designed. During the actuator test the instrument cluster circuitry will sound the chime tone generator, position each of the gauge needles at various specified calibration points, illuminate each of the segments in the Vacuum-Fluorescent Display (VFD), and turn all of the PCI data bus message-controlled indicators on and off again.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the PCI data bus, the Powertrain Control Module (PCM), the Airbag Control Module (ACM), the Sentry Key Immobilizer Module (SKIM), or the inputs to one of these electronic control modules. Use a DRBIII® scan tool to diagnose these components. Refer to the appropriate diagnostic information.

If an individual gauge does not respond properly, or does not respond at all during the actuator test, the instrument cluster should be removed. However, check that the screws securing the inoperative gauge to the instrument cluster electronic circuit board are properly tightened before considering instrument cluster replacement. If the gauge mounting screws check OK, replace the faulty instrument cluster.

(1) Begin the test with the ignition switch in the Off position.

(2) Depress the odometer/trip odometer switch button.

(3) While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the On position, but do not start the engine.

(4) Release the odometer/trip odometer switch button.

(5) The instrument cluster will automatically begin the actuator test sequence, as follows:

(a) The cluster will generate a single chime tone to confirm the functionality of the chime tone generator and the chime control circuitry.

(b) The cluster will scroll the number "8" across the odometer/trip odometer VFD to confirm the functionality of all VFD segments and their control circuitry.

(c) The cluster will illuminate the decimal point in the odometer/trip odometer VFD to confirm the functionality of this VFD segment and its control circuitry.

(d) The cluster will display the EMIC software level in the odometer/trip odometer VFD (example: "SOF 8.9").

(e) The cluster will display the last six digits (sequence number) of the Vehicle Identification Number (VIN) in the odometer/trip odometer VFD.

(f) If any faults have been set by the cluster, the cluster will display the fault information in the odometer/trip odometer VFD INSTRUMENT CLUSTER FAILURE MESSAGE . If no faults have been set, the cluster will scroll "no FAULTS" across the odometer/trip odometer VFD.

(g) The cluster will turn on, then off again each of the following indicators, one at a time, in sequence to confirm the functionality of the indicator and the cluster control circuitry:

- High Beam
- Brake
- Seatbelt
- MIL
- Check Gauges
- Low Fuel
- Full Time
- Part Time
- SKIS
- Cruise
- Upshift

(h) The cluster will sweep the needles for each of the following gauges, one at a time, to several calibration points in sequence to confirm the functionality of the gauge and the cluster control circuitry:

- Speedometer
- Fuel
- Temperature
- Tachometer
- Voltage
- Oil Pressure

## INSTRUMENT CLUSTER (Continued)

## INSTRUMENT CLUSTER FAILURE MESSAGE

VFD Message	Description	Correction
"buS b0"	PCM - MIL Message	The cluster is not receiving a MIL lamp message from the PCM. A DRBIII® scan tool is required for further diagnosis. Refer to the appropriate diagnostic information.
"buS b1"	SKIM - SKIM Message	The cluster is not receiving a SKIS lamp message from the SKIM. A DRBIII® scan tool is required for further diagnosis. Refer to the appropriate diagnostic information.
"buS b8"	ACM - Airbag Message	The cluster is not receiving an Airbag lamp message from the ACM. A DRBIII® scan tool is required for further diagnosis. Refer to the appropriate diagnostic information.
"PanEL OPen"	Panel Sense - Open Circuit	The cluster is not receiving an input from the the panel lamps dimmer circuitry of the left multi-function switch on the panel lamps dimmer signal circuit. Repair the open circuit or replace the faulty switch as required.
"Airbag"	Telltale Open/Shorted	The EMIC airbag indicator is open or shorted. Replace the faulty cluster.

(6) The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test, if the ignition switch is turned to the Off position during the test, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM over the PCI data bus during the test.

(7) Go back to Step 1 to repeat the test, if required.

## CHIME SERVICE DIAGNOSIS

Before performing this test, complete the testing of each of the hard wired chime warning system switches. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG**

**SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE: The following tests may not prove conclusive in the diagnosis of this system. The most reliable, efficient, and accurate means to diagnose the Chime Service function of the instrument cluster requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.**

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel.

(2) Disconnect the cross body wire harness connector for the ignition switch from the switch connector receptacle. Check for continuity between the key-in switch sense circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted key-in switch sense circuit as required.

(3) Check for continuity between the key-in switch sense circuit cavities of the instrument panel wire harness connector for the instrument cluster (Connector C2) and the cross body wire harness connector for the ignition switch. There should be continuity. If OK, go to Step 4. If not OK, repair the open key-in ignition switch sense circuit between the instrument cluster and the ignition switch as required.

## INSTRUMENT CLUSTER (Continued)

(4) Disconnect the floor wire harness connector from the seat belt switch pigtail wire connector. Check for continuity between the seat belt switch sense circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted seat belt switch sense circuit between the instrument cluster and the seat belt switch as required.

(5) Check for continuity between the seat belt switch sense circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the floor wire harness connector for the seat belt switch. There should be continuity. If OK, refer to PRELIMINARY DIAGNOSIS . If not OK, repair the open seat belt switch sense circuit between the instrument cluster and the seat belt switch as required.

## INTERIOR LIGHTING CONTROL DIAGNOSIS

Before performing this test, complete the testing of each of the hard wired interior lighting switches. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE:** The following tests may not prove conclusive in the diagnosis of this system. The most reliable, efficient, and accurate means to diagnose the Interior Lighting Control function of the instrument cluster requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

(1) Check the door ajar switch output fuse (Fuse 4 - 10 ampere) in the fuse block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for continuity between the door ajar switch output fuse (Fuse 4 - 10 ampere) in the fuse block and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open ground circuit between the fuse block and ground (G300) as required.

(3) Disconnect and isolate the battery negative cable. Disconnect the cross body wire harness connector for the driver and/or passenger door ajar switch from the switch connector receptacle. Check for continuity between the door ajar switch output circuit cavity of the driver or passenger door ajar switch and a good ground. There should be continuity. If OK, go to Step 4. If not OK, repair the open door ajar switch output circuit between the driver or passenger door ajar switch and the fuse block as required.

(4) Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the cluster connector receptacle. Check for continuity between the driver and/or passenger door ajar switch sense circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted driver and/or passenger door ajar switch sense circuits between the instrument cluster and the driver and/or passenger door ajar switches as required.

(5) Check for continuity between the driver and/or passenger door ajar switch sense circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the cross body wire harness connector for the driver and/or passenger door ajar switches. There should be continuity. If OK, use a DRBIII® scan tool to complete the diagnosis of the instrument cluster interior lighting control. Refer to the appropriate diagnostic information. If not OK, repair the open driver and/or passenger door ajar switch sense circuits between the instrument cluster and the driver and/or passenger door ajar switches as required.

## REAR WINDOW DEFOGGER CONTROL DIAGNOSIS

Before performing this test, complete the testing of the rear window defogger switch and the rear window defogger relay. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## INSTRUMENT CLUSTER (Continued)

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Remove the rear window defogger relay from the receptacle in the Power Distribution Center (PDC). Disconnect the instrument panel wire harness connector for the rear window defogger switch from the switch connector receptacle. Remove the instrument cluster from the instrument panel.

(2) Check for continuity between the rear window defogger switch sense circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted rear window defogger switch sense circuit between the instrument cluster and the rear window defogger switch as required.

(3) Check for continuity between the rear window defogger switch sense circuit cavities of the instrument panel wire harness connectors for the instrument cluster (Connector C2) and the rear window defogger switch. There should be continuity. If OK, go to Step 4. If not OK, repair the open rear window defogger switch sense circuit between the instrument cluster and the rear window defogger switch as required.

(4) Check for continuity between the rear window defogger relay control circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted rear window defogger relay control circuit between the instrument cluster and the PDC as required.

(5) Check for continuity between the rear window defogger relay control circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the rear window defogger relay receptacle in the PDC. There should be continuity. If OK, replace the faulty instrument cluster. If not OK, repair the open rear window defogger relay control circuit between the instrument cluster and the PDC as required.

## CLUSTER ILLUMINATION DIAGNOSIS

The diagnosis found here addresses an inoperative instrument cluster illumination lamp condition. If the problem being diagnosed is a single inoperative illumination lamp, be certain that the bulb and bulb holder unit are properly installed in the instrument cluster electronic circuit board. If no installation problems are found replace the faulty bulb and bulb holder unit. If all of the cluster illumination lamps are inoperative and the problem being diagnosed includes inoperative exterior lighting controlled by the left multi-function switch, that system needs to be repaired first. If the exterior lamps controlled by the left multi-function switch are inoperative, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP - DIAGNOSIS AND TESTING). If no exterior lighting system problems are found, the following procedure will help locate a short or open in the cluster illumination lamp circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Disconnect the cross body wire harness connector for the left multi-function switch from the switch connector receptacle. Check for continuity between the ground circuit cavity of the cross body wire harness connector for the left multi-function switch and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground (G300) as required.

(2) Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the cluster connector receptacle. Check for continuity between the panel lamp dimmer signal circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster

## INSTRUMENT CLUSTER (Continued)

and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted panel lamp dimmer signal circuit between the instrument cluster and the left multi-function switch as required.

(3) Check for continuity between the panel lamp dimmer signal circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the cross body wire harness connector for the left multi-function switch. There should be continuity. If OK, use a DRBIII® scan tool to complete the diagnosis of the instrument cluster illumination lighting. Refer to the appropriate diagnostic information. If not OK, repair the open panel lamp dimmer signal circuit between the instrument cluster and the left multi-function switch as required.

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the four screws that secure the instrument cluster to the instrument panel structural support (Fig. 2).

(4) Pull the instrument cluster forward far enough to access and disconnect the two instrument panel wire harness connectors for the instrument cluster from the connector receptacles on the back of the cluster housing.

(5) Remove the instrument cluster from the instrument panel.

## DISASSEMBLY

Some of the components for the instrument cluster used in this vehicle are serviced individually. The serviced components include: the incandescent instrument cluster indicator and illumination lamp bulbs (including the integral bulb holders), the cluster lens, the trip odometer reset knob boot, the cluster hood and mask unit, and the cluster housing rear

**Fig. 2 Instrument Cluster Remove/Install**

- 1 - WIRE HARNESS CONNECTORS
- 2 - INSTRUMENT CLUSTER
- 3 - SCREW (4)
- 4 - INSTRUMENT PANEL

cover. Following are the procedures for disassembling these components from the instrument cluster unit.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## CLUSTER BULB

This procedure applies to each of the incandescent cluster illumination lamp or indicator bulb and bulb holder units. However, the illumination lamps and the indicators use different bulb and bulb holder unit sizes. They must never be interchanged.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Turn the bulb holder counterclockwise about sixty degrees on the cluster electronic circuit board (Fig. 3).

## INSTRUMENT CLUSTER (Continued)

80b8e5f2

**Fig. 3 Cluster Bulb Locations**

1 - CLUSTER INCANDESCENT BULBS

(4) Pull the bulb and bulb holder unit straight back to remove it from the bulb mounting hole in the cluster electronic circuit board.

**CLUSTER LENS**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Work around the perimeter of the cluster lens and disengage each of the latches that secure the lens to the cluster housing (Fig. 4).

4 - CLUSTER LENS

5 - RESET KNOB BOOT

(4) Gently pull the cluster lens away from the cluster housing.

**TRIP ODOMETER RESET KNOB BOOT**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the cluster lens from the cluster housing. Refer to CLUSTER LENS for the proper cluster lens removal procedures.

(4) Remove the odometer reset knob boot by pulling it out from the face of the cluster lens (Fig. 4).

**CLUSTER HOOD AND MASK**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the cluster lens from the cluster housing. Refer to CLUSTER LENS for the proper cluster lens removal procedures.

(4) Work around the perimeter of the cluster hood and mask unit and disengage each of the latches that secure the cluster hood and mask unit to the cluster housing (Fig. 4).

(5) Gently pull the cluster hood and mask unit away from the cluster housing.

**CLUSTER HOUSING REAR COVER**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the two screws that secure the rear cover to the cluster housing.

(4) Work around the perimeter of the cluster housing rear cover and disengage each of the latches that secure the cover to the outside of the cluster housing (Fig. 4).

(5) Disengage the one inboard latch located near the lower edge of the rear cover just right of center that secures the rear cover to the cluster housing.

(6) Gently pull the cluster housing rear cover away from the back of the cluster housing.

## INSTRUMENT CLUSTER (Continued)

## ASSEMBLY

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## CLUSTER BULB

This procedure applies to each of the incandescent cluster illumination lamp or indicator bulb and bulb holder units. However, the illumination lamps and the indicators use different bulb and bulb holder unit sizes. They must never be interchanged.

**CAUTION: Be certain that any bulb and bulb holder unit removed from the cluster electronic circuit board is reinstalled in the correct position. Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the instrument cluster, the electronic circuit board and/or the gauges.**

- (1) Insert the bulb and bulb holder unit straight into the correct bulb mounting hole in the cluster electronic circuit board (Fig. 3).
- (2) With the bulb holder fully seated against the cluster electronic circuit board, turn the bulb holder clockwise about sixty degrees to lock it into place.
- (3) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (4) Reconnect the battery negative cable.

## CLUSTER LENS

- (1) Align the cluster lens with the cluster hood and mask unit (Fig. 4). Be certain that the trip odometer reset knob boot is aligned with the reset switch knob.
- (2) Press firmly and evenly on the cluster lens to install it onto the cluster housing.
- (3) Work around the perimeter of the cluster lens to be certain that each of the latches that secure the lens to the cluster housing is fully engaged.
- (4) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (5) Reconnect the battery negative cable.

## TRIP ODOMETER RESET KNOB BOOT

- (1) Position the trip odometer reset knob boot to the mounting hole from the back of the cluster lens (Fig. 4).
- (2) Gently pull the trip odometer reset knob boot into the mounting hole from the face of the cluster lens.
- (3) Reinstall the cluster lens onto the cluster housing. Refer to CLUSTER LENS for the proper cluster lens installation procedures.
- (4) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (5) Reconnect the battery negative cable.

## CLUSTER HOOD AND MASK

- (1) Align the cluster hood and mask unit with the cluster housing (Fig. 4).
- (2) Press firmly and evenly on the cluster hood and mask unit to install it onto the cluster housing.
- (3) Work around the perimeter of the cluster hood and mask unit to be certain that each of the latches that secure the hood and mask unit to the cluster housing is fully engaged.
- (4) Reinstall the cluster lens onto the cluster housing. Refer to CLUSTER LENS for the proper cluster lens installation procedures.
- (5) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (6) Reconnect the battery negative cable.

## CLUSTER HOUSING REAR COVER

- (1) Position the cluster housing rear cover to the back of the cluster housing.
- (2) Press firmly and evenly on the cluster housing rear cover to install it onto the cluster housing.
- (3) Work around the perimeter of the cluster housing rear cover to be certain that each of the latches that secure the rear cover to the cluster housing is fully engaged.
- (4) Install and tighten the two screws that secure the rear cover to the cluster housing. Tighten the screws to 2 N·m (20 in. lbs.).
- (5) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (6) Reconnect the battery negative cable.

## INSTRUMENT CLUSTER (Continued)

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

- (1) Position the instrument cluster to the instrument panel.
- (2) Reconnect the two instrument panel wire harness connectors for the instrument cluster to the connector to the connector receptacles on the back of the cluster housing (Fig. 2).
- (3) Position the instrument cluster to the instrument panel structural support.
- (4) Install and tighten the four screws that secure the instrument cluster to the instrument panel structural support. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
- (6) Reconnect the battery negative cable.

**NOTE:** Some of the indicators in a new instrument cluster are automatically configured (airbag, cruise, and Sentry Key Immobilizer System indicators) when the cluster is connected to the vehicle electrical system. This feature allows those indicators to be automatically enabled for compatibility with certain optional equipment.

## ABS INDICATOR

## DESCRIPTION

An Antilock Brake System (ABS) indicator is standard equipment on all instrument clusters, but is only functional on vehicles equipped with the ABS option. The ABS indicator is located near the lower edge of the instrument cluster overlay, to the left of the odometer/trip odometer Vacuum-Fluorescent Display (VFD). The ABS indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Failure of Anti-lock Braking System" in the opaque layer of the instrument cluster

overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The ABS indicator is serviced as a unit with the instrument cluster.

## OPERATION

The ABS indicator gives an indication to the vehicle operator when the ABS system is faulty or inoperative. This indicator is hard wired on the instrument cluster electronic circuit board, and is completely controlled by the Controller Antilock Brake (CAB). The ABS indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the CAB through the CAB relay in the Power Distribution Center (PDC). The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The indicator is turned on by the CAB for about two seconds after the ignition switch is turned to the On position as a bulb test. After the bulb test, the CAB turns the indicator on or off based upon the results of the ABS self-tests. If the CAB turns the indicator on after the bulb test, it indicates that the CAB has detected a system malfunction and/or that the ABS system has become inoperative. (Refer to 5 - BRAKES - DESCRIPTION). The ABS indicator can be diagnosed using conventional diagnostic tools and methods.

## DIAGNOSIS AND TESTING - ABS INDICATOR

The diagnosis found here addresses an inoperative Antilock Brake System (ABS) indicator condition. If there are problems with several indicators in the instrument cluster, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the ABS indicator stays on with the ignition switch in the On position or comes on and stays on while driving, (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If no ABS problem is found, the following procedure will help to locate a short or open in the ABS indicator lamp circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing

## ABS INDICATOR (Continued)

and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the connector receptacle on the back of the cluster housing. Reconnect the battery negative cable. Turn the ignition switch to the On position and within about two seconds check for continuity between the ABS warning indicator driver circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be continuity for about two seconds after ignition On, and then an open circuit. If OK, proceed to the diagnosis for the ABS brake system. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If not OK, go to Step 2.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the Controller Antilock Brake (CAB) relay from the receptacle in the Power Distribution Center (PDC). Check for continuity between the ABS warning indicator driver circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted ABS warning indicator driver circuit between the instrument cluster and the PDC as required.

(3) Check for continuity between the ABS warning indicator driver circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the CAB relay receptacle in the PDC. There should be continuity. If OK, proceed to the diagnosis for the ABS brake system. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If not OK, repair the open ABS warning indicator driver circuit between the instrument cluster and the PDC as required.

## AIRBAG INDICATOR

## DESCRIPTION

An airbag indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with airbags, this indicator is electronically disabled. The airbag indicator is located near the lower edge of the instrument cluster overlay, to the right of the odometer/trip odometer Vacuum-Fluorescent Display (VFD). The airbag indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Airbag" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when the it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The airbag indicator is serviced as a unit with the instrument cluster.

## OPERATION

The airbag indicator gives an indication to the vehicle operator when the airbag system is faulty or inoperative. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Airbag Control Module (ACM) over the Programmable Communications Interface (PCI) data bus. The airbag indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the airbag indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the airbag indicator is illuminated for about seven seconds. The first two seconds is the cluster bulb test function, and the remainder is the ACM bulb test function.

- **ACM Lamp-On Message** - Each time the cluster receives a lamp-on message from the ACM, the airbag indicator will be illuminated. The indicator remains illuminated for about twelve seconds or until the cluster receives a lamp-off message from the ACM, whichever is longer.

- **Communication Error** - If the cluster receives no airbag messages for five consecutive seconds, the airbag indicator is illuminated. The indicator

## AIRBAG INDICATOR (Continued)

remains illuminated for about twelve seconds or until the cluster receives a single lamp-off message from the ACM, whichever is longer.

- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The ACM continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ACM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the ACM sends a lamp-on message after the bulb test, it indicates that the ACM has detected a system malfunction and/or that the airbags may not deploy when required, or may deploy when not required. The ACM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ACM of the condition and stores a DTC. For further diagnosis of the airbag indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the airbag system, the ACM, the PCI data bus, or the message inputs to the instrument cluster that control the airbag indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## BRAKE/PARK BRAKE INDICATOR

### DESCRIPTION

A brake indicator is standard equipment on all instrument clusters. The brake indicator is located near the lower edge of the instrument cluster overlay, to the left of the odometer/trip odometer Vacuum-Fluorescent Display (VFD). The brake indicator consists of a stencil-like cutout of the word "BRAKE" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the "BRAKE" text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The brake indicator is serviced as a unit with the instrument cluster.

### OPERATION

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, or when there are certain brake hydraulic system malfunctions. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming, electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus, and hard wired inputs to the instrument cluster from the park brake switch and the brake warning indicator switch. The brake indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On or Start positions the brake indicator is illuminated for about four seconds as a bulb test.

- **Park Brake Switch Input** - Each time the cluster detects ground on the red brake warning indicator driver circuit (park brake switch closed = park brake applied or not fully released) the brake indicator is illuminated solid. If a vehicle speed message is received by the cluster from the PCM over the PCI data bus indicating the vehicle is moving while the red brake warning indicator driver input is ground, the brake indicator is flashed on and off repeatedly. Whether illuminated solid or flashing, the indicator remains illuminated until the red brake warning indicator driver input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Brake Hydraulic System Malfunction** - Each time the cluster detects ground on the red brake warning indicator driver circuit (brake warning indicator switch closed = pressures in the two halves of the split brake hydraulic system are unequal) the brake indicator is illuminated solid. The indicator remains illuminated until the red brake warning indicator driver input to the cluster is an open circuit (brake warning indicator switch open = brake hydraulic system pressures are equal), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned on, then off again during the

## BRAKE/PARK BRAKE INDICATOR (Continued)

bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch and the brake warning pressure switch are each connected in parallel between ground and the red brake warning indicator driver input to the instrument cluster so that each of their inputs will illuminate the indicator independently of the other. The park brake switch and brake warning indicator switch inputs to the instrument cluster can be diagnosed using conventional diagnostic tools and methods. (Refer to 5 - BRAKES/PARKING BRAKE - OPERATION). (Refer to 5 - BRAKES/ELECTRICAL/BRAKE PRESSURE SWITCH - OPERATION). For further diagnosis of the brake indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the brake indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

**DIAGNOSIS AND TESTING - BRAKE INDICATOR**

The diagnosis found here addresses an inoperative brake indicator condition. If there are problems with several indicators in the instrument cluster, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the brake indicator lamp stays on with the ignition switch in the On position and the park brake released, or comes on while driving, (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If no brake system problem is found, the following procedures will help to locate a shorted or open circuit, or a faulty switch input. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED**

(1) Disconnect and isolate the battery negative cable. Disconnect the floor wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to Step 2. If not OK, replace the faulty park brake switch.

(2) Disconnect the headlamp and dash wire harness connector for the brake warning indicator switch from the switch terminals. Check for continuity between the red brake warning indicator driver (G9) circuit cavities of the floor wire harness connector for the park brake switch and the headlamp and dash wire harness connector for the brake warning indicator switch. There should be continuity. If not OK, repair the open red brake warning indicator driver (G9) circuit between the park brake switch and the brake warning indicator switch as required.

**INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OK**

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the connector receptacle on the back of the cluster housing. Disconnect the headlamp and dash wire harness connector for the brake warning indicator switch from the switch terminals. Check for continuity between the red brake warning indicator driver circuit (G99) cavity of the headlamp and dash wire harness connector for the brake warning indicator switch and a good ground. There should be no continuity. If OK, go to Step 2. If not OK, repair the shorted red brake warning indicator driver circuit (G99) between the brake warning indicator switch and the instrument cluster as required.

(2) Disconnect the floor wire harness connector for the park brake switch from the switch terminals. Check for continuity between the red brake warning indicator driver circuit (G9) cavity of the headlamp and dash wire harness connector for the brake warning indicator switch and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted red brake warning indicator driver circuit (G9) between the brake warning indicator switch and the park brake switch as required.

(3) Check for continuity between each of the two terminals of the brake warning indicator switch and a good ground. In each case, there should be no continuity. If OK, go to Step 4. If not OK, replace the faulty brake warning indicator switch.

## BRAKE/PARK BRAKE INDICATOR (Continued)

(4) Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity with the park brake applied. If not OK, replace the faulty park brake switch.

## CHECK GAUGES INDICATOR

## DESCRIPTION

A check gauges indicator is standard equipment on all instrument clusters. The check gauges indicator is located on the lower edge of the instrument cluster overlay, to the right of the odometer/trip odometer Vacuum-Fluorescent Display (VFD). The check gauges indicator consists of a stencil-like cutout of the words "CHECK GAUGES" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the "CHECK GAUGES" text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The check gauges indicator is serviced as a unit with the instrument cluster.

## OPERATION

The check gauges indicator gives an indication to the vehicle operator when certain instrument cluster gauge readings reflect a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The check gauges indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a ground path by the instrument cluster transistor. The instrument cluster will turn on the check gauges indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the check gauges indicator is illuminated for about two seconds as a bulb test.
- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is about

127° C or higher (about 261° F or higher), the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine temperature is about 124° C or lower (about 255° F or lower), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Oil Pressure Low Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is about 0.3 kg/cm or lower (about 4 psi or lower), the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine oil pressure is about 0.6 kg/cm or higher (about 8 psi or higher), or until the ignition switch is turned to the Off position, whichever occurs first. The cluster will only turn the indicator on in response to an engine oil pressure low message if the engine speed is 300 rpm or greater.

- **Charge Fail Message** - Each time the cluster receives a message from the PCM indicating a charge fail condition (system voltage is nine volts or lower), the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating there is no charge fail condition (system voltage twelve volts or higher, but lower than sixteen volts) or until the ignition switch is turned to the Off position, whichever occurs first.

- **Voltage High Message** - Each time the cluster receives a message from the PCM indicating a voltage high condition (system voltage is sixteen volts or higher), the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating there is no voltage high condition (system voltage is sixteen volts or lower, but higher than nine volts) or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the check gauges indicator will be turned on, then off again during the bulb check portion of the test in order to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine temperature, oil pressure, and electrical system voltage, then sends the proper messages to the instrument cluster. For further diagnosis of the check gauges indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the check gauges indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## CRUISE INDICATOR

### DESCRIPTION

A cruise indicator is standard equipment on all instrument clusters, but is only functional on vehicles equipped with the optional speed control system. The cruise indicator is located near the upper edge of the instrument cluster overlay, in the upper left quadrant of the cluster. The cruise indicator consists of a stencil-like cutout of the word "CRUISE" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green lens behind the cutout in the opaque layer of the overlay causes the "CRUISE" text to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. When the exterior lighting is turned On, the illumination intensity of the cruise indicator is one-step dimmable, which is adjusted using the panel lamps dimmer control ring on the left multi-function switch control stalk. The cruise indicator is serviced as a unit with the instrument cluster.

### OPERATION

The cruise indicator gives an indication to the vehicle operator when the speed control system is turned On, regardless of whether the speed control is engaged. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The cruise indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided with a path to ground by the instrument cluster transistor. The instrument cluster will turn on the cruise indicator for the following reasons:

- **Cruise Lamp-On Message** - Each time the cluster receives a cruise lamp-on message from the PCM indicating the speed control system has been turned On, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a cruise lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the cruise indicator will be turned on, then off again during the bulb check portion of the test in order to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the speed control switches to determine the proper outputs to the speed control servo. The PCM then sends the proper cruise indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the cruise indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the speed control system, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the cruise indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## ENGINE TEMPERATURE GAUGE

### DESCRIPTION

An engine coolant temperature gauge is standard equipment on all instrument clusters. The engine coolant temperature gauge is located in the lower right quadrant of the instrument cluster, below the oil pressure gauge. The engine coolant temperature gauge consists of a movable gauge needle or pointer controlled by the instrument cluster electronic circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from 40° C (or 100° F) to 125° C (or 260° F). An International Control and Display Symbol icon for "Engine Coolant Temperature" is located on the cluster overlay, in the center of the gauge directly above the hub of the gauge needle. The engine coolant temperature gauge graphics are white and blue against a black field except for a single red graduation at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear white, the blue graphics appear blue, and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

## ENGINE TEMPERATURE GAUGE (Continued)

**OPERATION**

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the instrument cluster electronic circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The engine coolant temperature gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is between about 40° C (100° F) and 124° C (255° F), the gauge needle is moved to the appropriate linear position on the gauge scale to represent the actual engine temperature. The gauge needle will continue to be positioned at the actual temperature position on the gauge scale until the cluster receives a message from the PCM that indicates the engine temperature is low, high, or critical, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Temperature Low Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is at or below about 40° C (100° F), the gauge needle is held at the 40° C (100° F) graduation at the far left end of the gauge scale. The gauge needle remains at the far left end of the scale until the cluster receives a message from the PCM indicating that the engine temperature is above about 40° C (100° F), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is about 127° C or higher (about 261° F or higher), the gauge needle is moved to the center of the red zone on the gauge scale, the check gauges indicator is illuminated, and a single chime tone is sounded. The chime

tone feature will occur only once per ignition cycle. The gauge needle remains in the center of the red zone and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine temperature is about 124° C or lower (about 255° F or lower), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Temperature Critical Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is about 129° C or higher (about 264° F or higher), the gauge needle is moved to the far right end of the red zone on the gauge scale. The gauge needle remains at the far right end of the red zone until the cluster receives a message from the PCM indicating that the engine temperature is about 127° C or lower (about 261° F or lower), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Message Failure** - If the cluster fails to receive an engine temperature message for more than about twelve seconds, it will move the gauge needle to the minimum graduation of the gauge scale until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine coolant temperature gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the check gauges indicator due to a high or critical engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service. For proper diagnosis of the engine coolant temperature sensor, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the engine coolant temperature gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## FOG LAMP INDICATOR

### DESCRIPTION

A fog lamp indicator is standard equipment on all instrument clusters, but is only functional on vehicles equipped with the optional front and/or rear fog lamps. The fog lamp indicator is located near the upper edge of the instrument cluster overlay, in the upper left quadrant of the cluster. The fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Fog Lamps" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green lens behind the cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The fog lamp indicator is serviced as a unit with the instrument cluster.

### OPERATION

The fog lamp indicator gives an indication to the vehicle operator when the optional front and/or rear fog lamps are turned On. The availability of the front fog lamps, or rear fog lamps options varies by the market for which the vehicle is manufactured. This indicator is controlled by a hard wired input from the fog lamp switch circuitry of the left multi-function switch to the cluster. The fog lamp indicator Light Emitting Diode (LED) is grounded on the instrument cluster electronic circuit board at all times; therefore, the LED will be on anytime the front or rear fog lamps are turned on, regardless of the ignition switch position. The LED only illuminates when it is provided battery current by the fog lamp switch circuitry of the left multi-function switch.

The fog lamp switch circuitry of the left multi-function switch is connected in series between a fused B(+) fuse in the Power Distribution Center (PDC) and the front or rear fog lamp feed input to the instrument cluster through the fog lamp relay, which is also in the PDC. The fog lamp switch input to the instrument cluster can be diagnosed using conventional diagnostic tools and methods. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LEFT MULTI-FUNCTION SWITCH - OPERATION) for more information on the fog lamp switch.

## DIAGNOSIS AND TESTING - FRONT/REAR FOG LAMP INDICATOR

The diagnosis found here addresses an inoperative front/rear fog lamp indicator condition. Before beginning this test, confirm the functionality of the front or rear fog lamp system. If no fog lamp system problem is found, the following procedure will help to locate an open in the front or rear fog lamp feed circuit between the fog lamp relay and the instrument cluster. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C1) for the instrument cluster from the connector receptacle on the back of the cluster housing.

(2) Reconnect the battery negative cable. Turn the fog lamps on by pulling out the control knob on the end of the left-multi-function switch control stalk. Check for battery voltage at the front or rear fog lamp feed circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. If OK, replace the faulty instrument cluster. If not OK, repair the open front or rear fog lamp feed circuit between the fog lamp relay and the instrument cluster as required.

## FUEL GAUGE

### DESCRIPTION

A fuel gauge is standard equipment on all instrument clusters. The fuel gauge is located in the lower left quadrant of the instrument cluster, below the voltage gauge. The fuel gauge consists of a movable gauge needle or pointer controlled by the instrument cluster electronic circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from E (or Empty) to F (or Full). An International Control and Display Symbol icon for "Fuel" is located on the cluster overlay, in the center of the gauge directly above the hub of the gauge needle. An arrow-head icon pointed toward the left side of the vehicle is imprinted on the cluster overlay next to the "Fuel" icon in the fuel gauge to provide the driver with a reminder as to the location of the fuel filler access. The fuel gauge graphics are white and blue against a black field except for a single red graduation at the low end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear white, the blue graphics appear blue, and the red graphics appear red. The orange gauge needle is internally illuminated. Cluster illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The fuel gauge is serviced as a unit with the instrument cluster.

### OPERATION

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The fuel gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full, the cluster programming applies an algorithm to calculate the proper gauge needle position, then moves the gauge needle to the

proper position on the gauge scale. The algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the PCM. The gauge needle will continue to be positioned at the proper position on the gauge scale until the cluster receives a message from the PCM that indicates the percent tank full is less than empty, more than full, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Less Than 12.5 Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating that the percent tank full is less than 12.5 (one-eighth), the gauge needle is moved to the proper position on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the cluster receives messages from the PCM for a continuous twenty seconds indicating that the percent tank full has increased by more than 0.625 gallons or until the ignition switch is turned to the Off position, whichever occurs first. This strategy is intended to reduce the effect that fuel sloshing within the fuel tank can have on reliable indications. The chime tone feature will occur only once per ignition cycle.

- **Less Than Empty Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating that the percent tank full is less than empty, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is a short circuit.

- **More Than Full Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is more than full, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is an open circuit.

- **Message Failure** - If the cluster fails to receive a percent tank full message, it will hold the gauge needle at the last indication for about twelve seconds, until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first. After about twelve seconds, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence to confirm the functionality of the gauge and the cluster control circuitry.

## FUEL GAUGE (Continued)

The PCM continually monitors the fuel tank sending unit, then sends the proper messages to the instrument cluster. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the fuel tank sending unit, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the fuel gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## HIGH BEAM INDICATOR

## DESCRIPTION

A high beam indicator is standard equipment on all instrument clusters. The high beam indicator is located near the upper edge of the instrument cluster overlay, between the tachometer and the speedometer. The high beam indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "High Beam" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A blue lens behind the cutout in the opaque layer of the overlay causes the icon to appear in blue through the translucent outer layer of the overlay when it is illuminated from behind by a replaceable incandescent bulb and bulb holder unit located on the instrument cluster electronic circuit board. The high beam indicator is serviced as a unit with the instrument cluster.

## OPERATION

The high beam indicator gives an indication to the vehicle operator when the headlamp high beams are illuminated, or when the exterior lamps are inadvertently left On. This indicator is controlled by a hard wired input from the headlamp beam select switch circuitry of the left multi-function switch to the cluster, and by the instrument cluster electronic circuit board based upon cluster programming and hard wired inputs from the head/park/fog lamp switch circuitry of the left multi-function switch, the driver door ajar switch, and the ignition switch. The high beam indicator bulb is grounded on the instrument cluster electronic circuit board at all times; therefore, the bulb will be illuminated anytime the headlamp high beams are turned on, regardless of the ignition switch position. The bulb only illuminates when it is provided battery current by the beam select switch circuitry of the left multi-function switch, or by the instrument cluster electronic circuit board. The instrument cluster will turn on the high beam indicator for the following reasons:

- **Beam Select Switch Input** - Each time the cluster detects battery current on the beam select switch sense circuit (beam select switch closed = high beams selected or optical horn feature activated) the high beam indicator will be illuminated solid. This input can occur when the headlamp high beams are selected or when the optical horn feature is activated. The indicator remains illuminated until the beam select switch sense input to the cluster is an open circuit (beam select switch open = high beams not selected and optical horn feature not activated), or until the exterior lighting is turned off, whichever occurs first.

- **Exterior Lamps-On Optical Warning** - Each time the cluster detects battery current on the headlamp switch output circuit (park or head lamp switch closed = exterior lighting is On), ground on the driver door ajar switch sense circuit (driver door ajar switch closed = driver door is open), and the fused ignition switch output (run-start) input is an open circuit (ignition switch is in a position other than On or Start), the high beam indicator will be flashed On and Off repeatedly. The indicator will continue to flash until the exterior lighting is turned Off, the driver door is closed, or the ignition switch is turned to the On or Start positions, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the high beam indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the bulb and the cluster control circuitry.

The headlamp beam select switch and circuitry is integral to the left multi-function switch on the steering column, and is connected in series between fused B(+) and the high beam indicator driver circuit input to the instrument cluster. The left multi-function switch inputs to the instrument cluster circuitry can be diagnosed using conventional diagnostic tools and methods. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LEFT MULTI-FUNCTION SWITCH - OPERATION). For further diagnosis of the high beam indicator or the instrument cluster circuitry that controls the indicator bulb, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

## DIAGNOSIS AND TESTING - HIGH BEAM INDICATOR

The diagnosis found here addresses an inoperative high beam indicator condition. Before beginning this test, confirm the functionality of the high beam indicator bulb and the cluster control circuitry by performing the instrument cluster actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the high beam indicator fails to illuminate during the actuator test,

## HIGH BEAM INDICATOR (Continued)

replace the indicator bulb and bulb holder with a known good unit and repeat the test. If the indicator still fails to illuminate, replace the faulty instrument cluster. If the problem being diagnosed is related to inoperative headlamp high beams, be certain to repair the headlamp system circuits and switches before attempting to diagnose or repair the high beam indicator. If no headlamp system problems are found and the high beam indicator illuminates during the instrument cluster actuator test, the following procedure will help locate an open in the high beam indicator driver circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C1) for the instrument cluster from the connector receptacle on the back of the cluster housing.

(2) Reconnect the battery negative cable. Turn the headlamps On and select the headlamp high beams with the left multi-function switch control stalk. Check for battery voltage at the high beam indicator driver circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. If OK, replace the faulty instrument cluster. If not OK, repair the open high beam indicator driver circuit between the instrument cluster and the left multi-function switch as required.

## LOW FUEL INDICATOR

### DESCRIPTION

A low fuel indicator is standard equipment on all instrument clusters. The low fuel indicator is located

near the lower edge of the instrument cluster overlay, to the left of the odometer/trip odometer Vacuum Fluorescent Display (VFD). The low fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Fuel" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The low fuel indicator is serviced as a unit with the instrument cluster.

### OPERATION

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The low fuel indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the low fuel indicator is illuminated for about two seconds as a bulb test.

- **Less Than 12.5 Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating that the percent tank full is less than 12.5 (one-eighth), the low fuel indicator is illuminated and a single chime tone is sounded. The low fuel indicator remains illuminated until the cluster receives messages from the PCM for a continuous twenty seconds indicating that the percent tank full has increased by more than 0.625 gallons or until the ignition switch is turned to the Off position, whichever occurs first. This strategy is intended to reduce the effect that fuel sloshing within the fuel tank can have on reliable indications. The chime tone feature will occur only once per ignition cycle.

## LOW FUEL INDICATOR (Continued)

- **Less Than Empty Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is less than empty, the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is a short circuit.

- **More Than Full Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is more than full, the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is an open circuit.

- **Actuator Test** - Each time the cluster is put through the actuator test, the low fuel indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel tank sending unit, then sends the proper messages to the instrument cluster. For further diagnosis of the low fuel indicator lamp or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the fuel tank sending unit, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the low fuel indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## MALFUNCTION INDICATOR LAMP MIL

### DESCRIPTION

A Malfunction Indicator Lamp (MIL) is standard equipment on all instrument clusters. The MIL is located near the lower edge of the instrument cluster overlay, to the right of the odometer/trip odometer Vacuum-Fluorescent Display (VFD). The MIL consists of a stencil-like cutout of the International Control and Display Symbol icon for "Engine" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The MIL is serviced as a unit with the instrument cluster.

### OPERATION

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnos-

tic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Programmable Communications Interface (PCI) data bus. The MIL Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the MIL for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about seven seconds as a bulb test.

- **PCM Lamp-On Message** - Each time the cluster receives a lamp-on message from the PCM, the indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. For some DTC's, if a problem does not recur, the PCM will send a lamp-off message automatically. Other DTC's may require that a fault be repaired and the PCM be reset before a lamp-off message will be sent. For more information on the PCM and the DTC set and reset parameters, (Refer to 25 - EMISSIONS CONTROL - OPERATION).

- **Communication Error** - If the cluster receives no lamp-on or lamp-off message from the PCM for twenty seconds, the MIL is illuminated by the instrument cluster and a "no BuS" message will appear in the odometer/trip odometer Vacuum Fluorescent Display (VFD) to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid lamp-on or lamp-off message is received from the PCM.

- **Actuator Test** - Each time the cluster is put through the actuator test, the MIL will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the MIL or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions system may

## MALFUNCTION INDICATOR LAMP MIL (Continued)

require service. For proper diagnosis of the fuel and emissions systems, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the MIL, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## ODOMETER

### DESCRIPTION

An odometer and trip odometer are standard equipment in all instrument clusters. The odometer and trip odometer information are displayed in a common electronic Vacuum Fluorescent Display (VFD), which is centered on the lower edge of the instrument cluster and visible through a small window cutout on the instrument cluster overlay. However, the odometer and trip odometer information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster electronic circuit board toggles the display between odometer and trip odometer modes by depressing the odometer/trip odometer switch knob that extends through the lower edge of the cluster lens, just right of the odometer VFD. Both the odometer and trip odometer information is stored in the instrument cluster memory.

The odometer can display values up to 999,999 kilometers (999,999 miles). The odometer will not roll over, but will latch at the maximum value. The trip odometer can display values up to 9999.9 kilometers (9999.9 miles) before it rolls over to zero. The odometer display does not have a decimal point and will not show values less than a full unit (kilometer or mile), the trip odometer display does have a decimal point and will show tenths of a unit (kilometer or mile). The unit of measure for the odometer and trip odometer display is not shown in the VFD. If the instrument cluster has a speedometer with a primary scale in kilometers-per-hour, the letters "KM" are printed on the cluster mask next to the VFD window to indicate the odometer unit of measure. During daylight hours (exterior lamps Off) the VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are On) an analog/digital (A/D) converter on the instrument cluster electronic circuit board converts the analog panel lamps dimmer input from the left multi-function switch to a digital dimming level signal for controlling the lighting level of the VFD. However, a "Parade" mode position of the panel lamps dimmer control ring of the left multi-function switch control stalk allows the VFD to be illuminated at full brightness while the exterior lamps are turned On during daylight hours.

The VFD, the trip odometer switch, and the trip odometer switch button are serviced as a unit with the instrument cluster. The rubber trip odometer

reset knob boot on the outside of the cluster lens is available for separate service replacement.

### OPERATION

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. This gauge is controlled by the instrument cluster electronic circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The odometer and trip odometer information is displayed by the instrument cluster Vacuum Fluorescent Display (VFD), and the VFD will display odometer or trip odometer cluster information whenever the driver door is opened or the ignition switch is turned to the On or Start positions. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer information. Each time the VFD is illuminated the display will automatically return to the last mode previously selected (odometer or trip odometer).

- **Trip Odometer Reset** - When the trip odometer reset switch is pressed and held for longer than about two seconds, trip odometer will be reset to 0.0 kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to be reset.

- **Message Failure** - If the cluster fails to receive a distance message during normal operation, it will hold and display the last data received until the ignition switch is turned to the Off position. If the cluster does not receive a distance message within one second after the ignition switch is turned to the On position, it will display the last distance message stored in the cluster memory. If the cluster is unable to display distance information due to an error internal to the cluster, either "888888" will be displayed in the VFD or the VFD will be blank.

- **Actuator Test** - Each time the cluster is put through the actuator test, the VFD will scroll the number "8" from right-to-left across the display, then illuminate the trip odometer decimal point "." in order to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed sensor, then sends the proper distance messages to the instrument cluster. For further diagnosis of the odometer/trip odometer or the instrument cluster circuitry that controls these functions, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the

## ODOMETER (Continued)

vehicle speed sensor, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the odometer/trip odometer, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## OIL PRESSURE GAUGE

## DESCRIPTION

An oil pressure gauge is standard equipment on all instrument clusters. The oil pressure gauge is located in the upper right quadrant of the instrument cluster, above the engine coolant temperature gauge. The oil pressure gauge consists of a movable gauge needle or pointer controlled by the instrument cluster electronic circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from 0 kg/cm (or 0 psi) to 5.4 kg/cm (or 80 psi). An International Control and Display Symbol icon for "Engine Oil" is located on the cluster overlay, in the center of the gauge directly above the hub of the gauge needle. The oil pressure gauge graphics are white and blue against a black field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear white, and the blue graphics appear blue. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The oil pressure gauge is serviced as a unit with the instrument cluster.

## OPERATION

The oil pressure gauge gives an indication to the vehicle operator of the engine oil pressure. This gauge is controlled by the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The oil pressure gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster electronic circuitry controls the gauge needle position and provides the following features:

- **Engine Oil Pressure Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is between about 0.3 kg/cm

(4 psi) and about 6.7 kg/cm (95 psi), the cluster moves the gauge needle to the appropriate linear position on the gauge scale to represent the actual engine oil pressure. The gauge needle will continue to be positioned at the actual engine oil pressure position on the gauge scale until the cluster receives a message from the PCM that indicates the engine oil pressure is low, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Oil Pressure Low Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is below about 0.3 kg/cm (4 psi), the gauge needle is moved to the minimum increment on the far left (low) end of the gauge scale, the check gauges indicator is illuminated, and a single chime tone is generated. The gauge needle remains at the low end of the scale and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine oil pressure is about 0.6 kg/cm (8 psi) or higher, or until the ignition switch is turned to the Off position, whichever occurs first. The cluster will only turn the check gauges indicator on in response to an engine oil pressure low message if the engine speed is 300 rpm or greater for more than about five seconds.

- **Message Failure** - If the cluster fails to receive an engine oil pressure message for more than about twelve seconds, it will move the gauge needle to the minimum graduation of the gauge scale until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper engine oil pressure messages to the instrument cluster. For further diagnosis of the oil pressure gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the check gauges indicator due to a low oil pressure gauge reading, it may indicate that the engine or the engine oiling system requires service. For proper diagnosis of the engine oil pressure sensor, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the oil pressure gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## SEATBELT WARNING INDICATOR

### DESCRIPTION

A seatbelt indicator is standard equipment on all instrument clusters. The seatbelt indicator is located near the center of the instrument cluster overlay, directly below the high beam indicator and above the odometer/trip odometer Vacuum Fluorescent Display (VFD). The seatbelt indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Seat Belt" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The seatbelt indicator is serviced as a unit with the instrument cluster.

### OPERATION

The seatbelt indicator gives an indication to the vehicle operator of the status of the driver side front seatbelt. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and a hard wired input from the seatbelt switch in the driver side front seatbelt buckle unit through the seat belt indicator driver circuit. The seatbelt indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about seven seconds, or until the ignition switch is turned to the Off position, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch input to the cluster.

- **Driver Side Front Seatbelt Not Buckled** - Following the seatbelt reminder function, each time the cluster detects a ground on the seat belt switch sense circuit (seatbelt switch closed = seatbelt unbuckled) with the ignition switch in the Start or

On positions, the seatbelt indicator will be illuminated. The seatbelt indicator remains illuminated until the seat belt switch sense input to the cluster is an open circuit (seatbelt switch open = seatbelt buckled), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the seatbelt indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The seatbelt switch is connected in series between ground and the seat belt switch sense input to the instrument cluster. The seatbelt switch input to the instrument cluster circuitry can be diagnosed using conventional diagnostic tools and methods. For further diagnosis of the seatbelt indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

## SHIFT INDICATOR (TRANSFER CASE)

### DESCRIPTION - PART TIME INDICATOR

A part time indicator is standard equipment on all instrument clusters. The part time indicator is located near the upper edge of the instrument cluster overlay, in the upper right quadrant of the cluster. The part time indicator consists of a stencil-like cutout of the words "PART TIME" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the "PART TIME" text to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. When the exterior lighting is turned On, the illumination intensity of the part time indicator is one-step dimmable, which is adjusted using the panel lamps dimmer control ring on the left multi-function switch control stalk. The part time indicator is serviced as a unit with the instrument cluster.

### DESCRIPTION - FULL TIME INDICATOR

A full time indicator is standard equipment on all instrument clusters, but is only functional on vehicles in some markets where the Selec-Trac four-wheel drive system is an available option. The full time indicator is located near the upper edge of the instrument cluster overlay, in the upper right quadrant of the cluster. The full time indicator consists of a sten-

## SHIFT INDICATOR (TRANSFER CASE) (Continued)

oil-like cutout of the words "FULL TIME" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green lens behind the cutout in the opaque layer of the cluster overlay causes the "FULL TIME" text to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. When the exterior lighting is turned On, the illumination intensity of the full time indicator is one-step dimmable, which is adjusted using the panel lamps dimmer control ring on the left multi-function switch control stalk. The full time indicator is serviced as a unit with the instrument cluster.

**OPERATION - PART TIME INDICATOR**

The part time indicator gives an indication to the vehicle operator that a part time operating mode of the four-wheel drive transfer case is selected. On vehicles equipped with the standard Command-Trac four-wheel drive system, the part time indicator lights when the transfer case is engaged in the 4H or 4L positions. On vehicles in some markets where the Selec-Trac four-wheel drive system is an available option, the part time indicator lights when the transfer case is engaged in the 4 X 4 Part Time or 4 Lo positions. This indicator is controlled by a transistor on the instrument cluster electronic circuit board, and is controlled by a hard wired transfer case switch input to the cluster. The part time indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the part time indicator for the following reasons:

- **Transfer Case Switch Input** - Each time the cluster detects a ground on the 4WD switch sense (part time) circuit (transfer case switch closed = part time 4WD selected) the part time indicator will be illuminated. The indicator remains illuminated until the 4WD switch sense (part time) input to the cluster is an open circuit (transfer case switch open = part time 4WD not selected), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the part time indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The transfer case switch is connected in series between ground and the 4WD switch sense (part-time) input to the instrument cluster. The transfer case switch input to the instrument cluster circuitry can be diagnosed using conventional diagnostic tools and methods. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - DESCRIPTION) for more information on the transfer case switch. For further diagnosis of the part time indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

**OPERATION - FULL TIME INDICATOR**

The full time indicator gives an indication to the vehicle operator that a full time operating mode of the four-wheel drive transfer case is selected. On vehicles in some markets where the Selec-Trac four-wheel drive system is an available option, the full time indicator lights when the transfer case is engaged in the 4 X 4 Full Time position. This indicator is controlled by a transistor on the instrument cluster electronic circuit board, and is controlled by a hard wired transfer case switch input to the cluster. The full time indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the full time indicator for the following reasons:

- **Transfer Case Switch Input** - Each time the cluster detects a ground on the 4WD switch sense (full time) circuit (transfer case switch closed = full time 4WD selected) the full time indicator will be illuminated. The indicator remains illuminated until the 4WD switch sense (full time) input to the cluster is an open circuit (transfer case switch open = full time 4WD not selected), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the full time indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The transfer case switch is connected in series between ground and the 4WD switch sense (full-time) input to the instrument cluster. The transfer case switch input to the instrument cluster circuitry can be diagnosed using conventional diagnostic tools and methods. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - DESCRIPTION) for more

## SHIFT INDICATOR (TRANSFER CASE) (Continued)

information on the transfer case switch. For further diagnosis of the part time indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

**DIAGNOSIS AND TESTING - PART TIME INDICATOR**

The diagnosis found here addresses an inoperative part time indicator condition. Before beginning this test, confirm the functionality of the part time indicator Light Emitting Diode (LED) and the cluster control circuitry by performing the instrument cluster actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the part time indicator fails to illuminate during the actuator test, replace the faulty instrument cluster. If the problem being diagnosed is related to indicator accuracy, be certain to confirm that the problem is with the indicator or transfer case switch and not a mechanical malfunction of the transfer case or transfer case shift linkage. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - DIAGNOSIS AND TESTING). If no transfer case problem is found, the following procedure will help to locate a short or open in the 4WD switch sense (part time) circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**INDICATOR DOES NOT ILLUMINATE WITH PART TIME MODE SELECTED**

(1) Disconnect and isolate the battery negative cable. Disconnect the engine wire harness connector for the transfer case switch from the transfer case switch connector receptacle. Check for continuity between the ground circuit cavity of the engine wire

harness connector for the transfer case switch and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground (G105) as required.

(2) Reconnect the battery negative cable. Turn the ignition switch to the On position. Install a jumper wire between the 4WD switch sense (part-time) circuit cavity of the engine wire harness connector for the transfer case switch and a good ground. The part time indicator should light. If OK, replace the faulty transfer case switch. If not OK, go to Step 3.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the connector receptacle on the back of the cluster housing. Check for continuity between the 4WD switch sense (part-time) circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the engine wire harness connector for the transfer case switch. There should be continuity. If OK, replace the faulty instrument cluster. If not OK, repair the open 4WD switch sense (part-time) circuit between the instrument cluster and the transfer case switch as required.

**INDICATOR STAYS ILLUMINATED WITH PART TIME MODE NOT SELECTED**

(1) Disconnect and isolate the battery negative cable. Disconnect the engine wire harness connector for the transfer case switch from the transfer case switch connector receptacle. Check for continuity between the ground circuit and the 4WD switch sense (part-time) circuit terminals in the transfer case switch connector receptacle. There should be no continuity. If OK, go to Step 2. If not OK, replace the faulty transfer case switch.

(2) Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the connector receptacle on the back of the cluster housing. Check for continuity between the 4WD switch sense (part-time) circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, replace the faulty instrument cluster. If not OK, repair the shorted 4WD switch sense (part-time) circuit between the transfer case switch and the instrument cluster as required.

**DIAGNOSIS AND TESTING - FULL TIME INDICATOR**

The diagnosis found here addresses an inoperative full time indicator condition. Before beginning this

## SHIFT INDICATOR (TRANSFER CASE) (Continued)

test, confirm the functionality of the full time indicator Light Emitting Diode (LED) and the cluster control circuitry by performing the instrument cluster actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the full time indicator fails to illuminate during the actuator test, replace the faulty instrument cluster. If the problem being diagnosed is related to indicator accuracy, be certain to confirm that the problem is with the indicator or transfer case switch and not a mechanical malfunction of the transfer case or transfer case shift linkage. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - DIAGNOSIS AND TESTING). If no transfer case problem is found, the following procedure will help to locate a short or open in the 4WD switch sense (full time) circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**INDICATOR DOES NOT ILLUMINATE WITH FULL TIME MODE SELECTED**

(1) Disconnect and isolate the battery negative cable. Disconnect the engine wire harness connector for the transfer case switch from the transfer case switch connector receptacle. Check for continuity between the ground circuit cavity of the engine wire harness connector for the transfer case switch and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground (G105) as required.

(2) Reconnect the battery negative cable. Turn the ignition switch to the On position. Install a jumper wire between the 4WD switch sense (full-time) circuit cavity of the engine wire harness connector for the transfer case switch and a good ground. The full time indicator should light. If OK, replace the faulty transfer case switch. If not OK, go to Step 3.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the connector receptacle on the back of the cluster housing. Check for continuity between the 4WD switch sense (full-time) circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the engine wire harness connector for the transfer case switch. There should be continuity. If OK, replace the faulty instrument cluster. If not OK, repair the open 4WD switch sense (full-time) circuit between the instrument cluster and the transfer case switch as required.

**INDICATOR STAYS ILLUMINATED WITH FULL TIME MODE NOT SELECTED**

There should be no continuity. If OK, replace the faulty instrument cluster. If not OK, repair the shorted 4WD switch sense (full-time) circuit between the transfer case switch and the instrument cluster as required.

## SPEEDOMETER

### DESCRIPTION

A speedometer is standard equipment in all instrument clusters. The speedometer is located next to the tachometer, just to the right of center in the instrument cluster. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster electronic circuitry and a fixed 210 degree primary outer scale on the cluster overlay that reads left-to-right either from 0 to 100 mph, from 0 to 110 mph, or from 0 to 180 km/h, depending upon the requirements of the market for which the vehicle was manufactured. Each version also has a secondary inner scale on the cluster overlay that provides the

## SPEEDOMETER (Continued)

equivalent opposite units from the primary scale. A label on the cluster overlay beneath the hub of the speedometer pointer abbreviates the unit of measure for the primary scale in all upper case letters (i.e.: MPH or KM/H), followed by the unit of measure for the secondary scale in all lower case letters (i.e.: mph or km/h). The speedometer graphics are white (primary scale) and blue (secondary scale) against a black field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear white and the blue graphics appear blue. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The speedometer is serviced as a unit with the instrument cluster.

## OPERATION

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The speedometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message** - Each time the cluster receives a vehicle speed message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that speed position on the gauge scale. The cluster will receive a new vehicle speed message and reposition the gauge pointer accordingly about every 86 milliseconds. The gauge needle will continue to be positioned at the actual vehicle speed position on the gauge scale until the ignition switch is turned to the Off position.

- **Message Failure** - If the cluster fails to receive a speedometer message, it will hold the gauge needle at the last indication for about six seconds, or until the ignition switch is turned to the Off position, whichever occurs first. If a new speedometer message is not received after about six seconds, the gauge needle will return to the far left (low) end of the scale.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the vehicle speed sensor to determine the vehicle road speed, then sends the proper vehicle speed messages to the instrument cluster. For further diagnosis of the speedometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the vehicle speed sensor, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the speedometer, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## TACHOMETER

### DESCRIPTION

A tachometer is standard equipment on all instrument clusters. The tachometer is located next to the speedometer, just to the left of center in the instrument cluster. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster electronic circuitry and a fixed 210 degree scale on the cluster overlay that reads left-to-right from 0 to 6. The text "X 1000 RPM" imprinted on the cluster overlay directly below the hub of the tachometer needle identifies that each number on the tachometer scale is to be multiplied by 1000 rpm. A red line on the high end of the gauge scale designates the engine overspeed area of the gauge. The tachometer graphics are white against a black field, except for the single red line, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear white and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The tachometer is serviced as a unit with the instrument cluster.

### OPERATION

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Com-

## TACHOMETER (Continued)

munications Interface (PCI) data bus. The tachometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster electronic circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message** - Each time the cluster receives an engine speed message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that speed position on the gauge scale. The cluster will receive a new engine speed message and reposition the gauge pointer accordingly about every 86 milliseconds. The gauge needle will continue to be positioned at the actual engine speed position on the gauge scale until the ignition switch is turned to the Off position.

- **Message Failure** - If the cluster fails to receive an engine speed message, it will hold the gauge needle at the last indication for about six seconds, or until the ignition switch is turned to the Off position, whichever occurs first. If a new engine speed message is not received after about six seconds, the gauge needle will return to the far left (low) end of the scale.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the crankshaft position sensor to determine the engine speed, then sends the proper engine speed messages to the instrument cluster. For further diagnosis of the tachometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the crankshaft position sensor, the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the tachometer, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## TURN SIGNAL INDICATORS

### DESCRIPTION

Two turn signal indicators, one right and one left, are standard equipment on all instrument clusters. The turn signal indicators are located near the upper edge of the instrument cluster overlay, between the speedometer and the tachometer. Each turn signal

indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Turn Warning" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents these icons from being clearly visible when they are not illuminated. A green lens behind each cutout in the opaque layer of the cluster overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The turn signal indicators are serviced as a unit with the instrument cluster.

### OPERATION

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected. These indicators are controlled by two individual hard wired inputs from the turn signal switch and hazard warning switch circuitry of the left multi-function switch to the cluster. Each turn signal indicator Light Emitting Diode (LED) is grounded on the instrument cluster electronic circuit board at all times; therefore, the LED can be on anytime the turn signal or hazard warning systems are turned on, regardless of the ignition switch position. Each LED will only illuminate when it is provided battery current by the turn signal switch or hazard warning switch circuitry of the left multi-function switch.

The turn signal switch and hazard warning switch circuitry of the left multi-function switch are connected in series between the output of the combination flasher on the left multi-function switch and the left or right turn signal inputs to the instrument cluster, but in parallel with the other turn signal circuits. This arrangement allows the turn signal indicators to remain functional, regardless of the condition of the other circuits in the turn signal and hazard warning systems. The turn signal switch and hazard warning switch inputs to the instrument cluster can be diagnosed using conventional diagnostic tools and methods. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LEFT MULTI-FUNCTION SWITCH - OPERATION) for more information on the turn signal switch and hazard warning switch.

### DIAGNOSIS AND TESTING - TURN SIGNAL INDICATOR

The diagnosis found here addresses an inoperative turn signal indicator condition. If the problem being diagnosed is related to inoperative turn signal or hazard warning lamps, be certain to repair the turn signal and hazard warning system before attempting

## TURN SIGNAL INDICATORS (Continued)

to diagnose or repair the turn signal indicators. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - DIAGNOSIS AND TESTING - TURN SIGNAL & HAZARD WARNING SYSTEM). If no turn signal and hazard warning system problem is found, the following procedure will help locate an open in the right or left turn signal circuits. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Disconnect the instrument panel wire harness connector (Connector C1) for the instrument cluster from the connector receptacle on the back of the cluster housing.

(2) Reconnect the battery negative cable. Activate the hazard warning system by moving the hazard warning switch button on the left multi-function switch to the On position. Check for battery voltage at the inoperative (right or left) turn signal circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. There should be a switching (on and off) battery voltage signal present. If OK, replace the faulty instrument cluster. If not OK, repair the open (right or left) turn signal circuit between the instrument cluster and the left multi-function switch as required.

## UPSHIFT INDICATOR

### DESCRIPTION

An upshift indicator is standard equipment on all instrument clusters, however, on vehicles not built for the United States or Canadian markets and those not equipped with a manual transmission, this indicator is electronically disabled. The upshift indicator

is located near the right upper edge of the instrument cluster overlay, just above the oil pressure gauge. The upshift indicator consists of an upward pointed arrow icon that is a stencil-like cutout in the opaque layer of the instrument cluster overlay. The dark outer layer of the cluster overlay prevents the icon from being clearly visible when the lamp is not illuminated. An amber lens behind the cutout in the opaque layer of the cluster overlay causes the icon to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. When the exterior lighting is turned On, the illumination intensity of the part time indicator is one-step dimmable, which is adjusted using the panel lamps dimmer control ring on the left multi-function switch control stalk. The upshift indicator is serviced as a unit with the instrument cluster.

### OPERATION

The upshift indicator gives an indication to the vehicle operator when the manual transmission should be shifted to the next highest gear in order to achieve the best fuel economy. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The upshift indicator function of the instrument cluster is electronically enabled or disabled by a PCI data bus message received by the cluster from the PCM. The upshift indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the upshift indicator for the following reasons:

- **Upshift Lamp-On Message** - Each time the cluster receives an upshift lamp-on message from the PCM indicating the engine speed and load conditions are right for a transmission upshift to occur, the upshift indicator is illuminated. The indicator remains illuminated until the cluster receives an upshift lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first. The PCM will normally send an upshift lamp-off message three to five seconds after a lamp-on message, if an upshift is not performed. The indicator will then remain off until the vehicle stops

## UPSHIFT INDICATOR (Continued)

accelerating and is brought back into the range of indicator operation, or until the transmission is shifted into another gear.

- **Actuator Test** - Each time the cluster is put through the actuator test, the upshift indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine speed and load conditions to determine the proper fuel and ignition requirements. The PCM then sends the proper upshift indicator messages to the instrument cluster. For further diagnosis of the upshift indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the PCM, the PCI data bus, or the message inputs to the instrument cluster that control the upshift indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## VOLTAGE GAUGE

## DESCRIPTION

A voltage gauge is standard equipment on all instrument clusters. The voltage gauge is located in the upper left quadrant of the instrument cluster, above the fuel gauge. The voltage gauge consists of a movable gauge needle or pointer controlled by the instrument cluster electronic circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from 9 volts to 19 volts. An International Control and Display Symbol icon for "Battery Charging Condition" is located on the cluster overlay, in the center of the gauge directly above the hub of the gauge needle. The voltage gauge graphics are white and blue against a black field except for a single red graduation at each end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear white, the blue graphics appear blue, and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The voltage gauge is serviced as a unit with the instrument cluster.

## OPERATION

The voltage gauge gives an indication to the vehicle operator of the electrical system voltage. This gauge is controlled by the instrument cluster elec-

tronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The voltage gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **System Voltage Message** - Each time the cluster receives a message from the PCM indicating the system voltage, the gauge needle is moved to the actual system voltage position on the gauge scale. The gauge needle will continue to be positioned at the actual system voltage position on the gauge scale until the cluster receives a message from the PCM that indicates the system voltage is low (charge fail), high, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Charge Fail Message** - Each time the cluster receives a message from the PCM indicating a charge fail condition (system voltage is nine volts or lower), the gauge needle is moved to the 9 volt graduation on the gauge scale and the check gauges indicator is illuminated. The gauge needle remains on the 9 volt graduation and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating there is no charge fail condition (system voltage is twelve volts or higher, but lower than sixteen volts), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Voltage High Message** - Each time the cluster receives a message from the PCM indicating a voltage high condition (system voltage is nineteen volts or higher), the gauge needle is moved to the 19 volt graduation on the gauge scale and the check gauges indicator is illuminated. The gauge needle remains on the 19 volt graduation and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating there is no voltage high condition (system voltage is sixteen volts or lower, but higher than nine volts), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Message Failure** - If the cluster fails to receive a system voltage message for more than about twelve seconds, it will move the gauge needle to the minimum graduation of the gauge scale until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

## VOLTAGE GAUGE (Continued)

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the system voltage to control the generator output. The PCM then sends the proper system voltage messages to the instrument cluster. For further diagnosis of the voltage gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRU-

MENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the check gauges indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service. For proper diagnosis of the charging system, the PCI data bus, or the message inputs to the instrument cluster that control the voltage gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## RESTRAINTS

### DESCRIPTION

**This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual**

**information is in the 2000 Model Year Service Manual.**

**When you are using this information you may be referred to another section of the Service Manual. The refer to is written differently than in prior years.**

## RESTRAINTS (Continued)

## DESCRIPTION

A dual front airbag system is standard factory-installed safety equipment on this model. The airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and vehicles with this equipment can be readily identified by the "SRS - AIRBAG" logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the instrument panel above the glove box (Fig. 1). Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the instrument cluster for about seven seconds as a bulb test each time the ignition switch is turned to the On position.

8098029e

*Fig. 1 SRS Logo*

The dual front airbag system consists of the following major components, which are described in further detail elsewhere in this service information:

- **Airbag Control Module** - The Airbag Control Module (ACM) is located on a mount on the floor panel transmission tunnel, below the center of the instrument panel.
- **Airbag Indicator** - The airbag indicator is integral to the ElectroMechanical Instrument Cluster (EMIC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Driver Airbag** - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a molded plastic structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- **Passenger Airbag** - The passenger airbag is located on the instrument panel, beneath the passen-

ger airbag door on the instrument panel above the glove box on the passenger side of the vehicle.

- **Passenger Airbag On/Off Switch** - The passenger airbag on/off switch is located in a dedicated opening in the forward end of the center console on the floor panel transmission tunnel.

- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.

The ACM and the EMIC each contain a central processing unit and programming that allow them to communicate with each other using the Programmable Communications Interface (PCI) data bus network. This method of communication is used for control of the airbag indicator on all models. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION).

Hard wired circuitry connects the airbag system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the airbag system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

The airbag system is referred to as a supplemental restraint system because it was designed and is intended to enhance the protection for the front seat occupants of the vehicle **only** when used in conjunction with the seat belts. It is referred to as a passive system because the vehicle occupants are not required to do anything to make it work. The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts. Seat belts are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them. The vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed airbag system.

The airbag system electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Airbag Control Module (ACM). An airbag indicator in the ElectroMe-

## RESTRAINTS (Continued)

chanical Instrument Cluster (EMIC) lights for about seven seconds as a bulb test each time the ignition switch is turned to the On or Start positions. Following the bulb test, the airbag indicator is turned on or off by the ACM to indicate the status of the airbag system. If the airbag indicator comes on at any time other than during the bulb test, it indicates that there is a problem in the airbag system electrical circuits. Such a problem may cause the airbags not to deploy when required, or to deploy when not required.

The clockspring on the top of the steering column allows a continuous electrical circuit to be maintained between the stationary steering column and the driver airbag inflator, which rotates with the steering wheel. The passenger airbag on/off switch allows the passenger side airbag to be disabled when circumstances necessitate that a child, or an adult with certain medical conditions be placed in the front passenger seating position. Refer to the owner's manual in the vehicle glove box for recommendations concerning the specific circumstances where the passenger airbag on/off switch should be used to disable the passenger airbag.

Deployment of the airbags depends upon the angle and severity of the impact. The airbag system is designed to deploy upon a frontal impact within a thirty degree angle from either side of the vehicle center line. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the airbag system impact sensor, which is integral to the ACM. When a frontal impact is severe enough, the microprocessor in the ACM signals the inflator units of both airbag modules to deploy the airbags. During a frontal vehicle impact, the knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel.

Typically, the driver and front seat passenger recall more about the events preceding and following a collision than they have of the airbag deployment itself. This is because the airbag deployment and deflation occur so rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until both airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, both airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat,

depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ACM monitors a problem in any of the airbag system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to turn on the airbag indicator. Proper testing of the airbag system components, the Programmable Communications Interface (PCI) data bus, the data bus message inputs to and outputs from the EMIC or the ACM, as well as the retrieval or erasure of a DTC from the ACM requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the factory-installed passenger restraints, including the airbag system.

**WARNING**

**WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTROMECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: THE DRIVER AIRBAG INFLATOR UNIT CONTAINS SODIUM AZIDE AND POTASSIUM NITRATE. THESE MATERIALS ARE POISONOUS AND EXTREMELY FLAMMABLE. CONTACT WITH ACID, WATER, OR HEAVY METALS MAY PRODUCE HARMFUL AND IRRITATING GASES (SODIUM HYDROXIDE IS FORMED IN THE PRESENCE OF MOISTURE) OR COMBUSTIBLE COMPOUNDS. THE PASSENGER AIRBAG UNIT CONTAINS ARGON GAS PRESSURIZED TO OVER 2500 PSI. DO NOT ATTEMPT TO DISMANTLE AN AIRBAG UNIT OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURES EXCEEDING 93° C (200° F).**

## RESTRAINTS (Continued)

**WARNING: REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE DAIMLERCHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION.**

**WARNING: THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE DAIMLERCHRYSLER MOPAR PARTS CATALOG.**

**WARNING: WHEN A STEERING COLUMN HAS AN AIRBAG UNIT ATTACHED, NEVER PLACE THE COLUMN ON THE FLOOR OR ANY OTHER SURFACE WITH THE STEERING WHEEL OR AIRBAG UNIT FACE DOWN.**

## DIAGNOSIS AND TESTING - AIRBAG SYSTEM

Proper diagnosis and testing of the airbag system components, the PCI data bus, the data bus message inputs to and outputs from the ElectroMechanical Instrument Cluster (EMIC) or the Airbag Control Module (ACM), as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) from the ACM requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## STANDARD PROCEDURE - HANDLING OF NON-DEPLOYED AIRBAGS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment. In addition, the airbag system should be disarmed whenever any steering wheel, steering column, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, faulty, or non-deployed driver or passenger airbags which are replaced on vehicles are to be returned. If an airbag unit is faulty or damaged and non-deployed, follow the instructions in the current Mopar Hazardous Material Awareness Manual or the current DaimlerChrysler Corporation Warranty Policies and Procedures manual for the proper handling and disposal procedures.

## AIRBAG STORAGE

Airbags must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks, and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

## STANDARD PROCEDURE - SERVICE AFTER AN AIRBAG DEPLOYMENT

Any vehicle which is to be returned to use following an airbag deployment, must have both airbags, the driver airbag trim cover, the horn switch, the clockspring, and the passenger airbag door replaced. These components are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. Other vehicle components should be closely inspected, but are to be replaced only as required by the extent of the visible damage incurred.

## RESTRAINTS (Continued)

## CLEANUP PROCEDURE

Following an airbag deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge used to initiate the propellant used to deploy the airbags. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the nitrogen gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be sure to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup (Fig. 2).

**Fig. 2 Wear Safety Glasses and Rubber Gloves - Typical**

918M-4

**WARNING: IF YOU EXPERIENCE SKIN IRRITATION DURING CLEANUP, RUN COOL WATER OVER THE AFFECTED AREA. ALSO, IF YOU EXPERIENCE IRRITATION OF THE NOSE OR THROAT, EXIT THE VEHICLE FOR FRESH AIR UNTIL THE IRRITATION CEASES. IF IRRITATION CONTINUES, SEE A PHYSICIAN.**

Begin the cleanup by removing both airbags from the vehicle. Refer to the appropriate service removal procedures. Place the deployed airbags in your vehicular scrap pile.

Next, use a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area. Be certain to vacuum the heater and air conditioning outlets as well (Fig. 3). Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

## STANDARD PROCEDURE - VERIFICATION TEST

The following procedure should be performed using a DRBIII® scan tool to verify proper airbag system operation following the service or replacement of any airbag system component.

**Fig. 3 Vacuum Heater and A/C Outlets - Typical**

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) During the following test, the battery negative cable remains disconnected and isolated, as it was during the airbag component removal and installation procedures.

(2) Be certain that the DRBIII® scan tool contains the latest version of the proper DRBIII® software. Connect the DRBIII® to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column (Fig. 4).

(3) Turn the ignition switch to the On position and exit the vehicle with the DRBIII®.

(4) Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.

(5) Using the DRBIII®, read and record the active (current) Diagnostic Trouble Code (DTC) data.

(6) Next, use the DRBIII® to read and record any stored (historical) DTC data.

(7) If any DTC is found in Step 5 or Step 6, refer to the appropriate diagnostic information.

(8) Use the DRBIII® to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to Step 9.

## RESTRAINTS (Continued)

**Fig. 4 16-Way Data Link Connector - Typical**

- 1 - 16-WAY DATA LINK CONNECTOR
- 2 - LOWER EDGE OF INSTRUMENT PANEL

(9) Turn the ignition switch to the Off position for about fifteen seconds, and then back to the On position. Observe the airbag indicator in the instrument cluster. It should light for six to eight seconds, and then go out. This indicates that the airbag system is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays on, there is still an active airbag system fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

## SPECIAL TOOLS

## AIRBAG SYSTEM

**Puller C-3428-B**

## AIRBAG CONTROL MODULE

## DESCRIPTION

80bf8d42

**Fig. 5 Airbag Control Module**

- 1 - SCREW (4)
- 2 - AIRBAG CONTROL MODULE
- 3 - WIRE HARNESS CONNECTOR
- 4 - MOUNTING BRACKET
- 5 - FRONT FLOOR PANEL

The Airbag Control Module (ACM) is secured with four screws to a mounting bracket that is welded onto the top of the floor panel transmission tunnel below the instrument panel and forward of the center floor console in the passenger compartment of the vehicle (Fig. 5). The ACM contains an electronic microprocessor, an electronic impact sensor, an electromechanical safing sensor, and an energy storage capacitor. The ACM is connected to the vehicle electrical system through a dedicated take out and connector of the cross body wire harness.

The ACM cannot be repaired or adjusted and, if damaged or faulty, it must be replaced.

## OPERATION

The microprocessor in the ACM contains the airbag system logic circuits, and it monitors and controls all of the airbag system components. The ACM also uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the DRBIII® scan tool using the Programmable Communications Interface (PCI) data bus network. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and for airbag system diagnosis and testing through the 16-way data link connector located on the lower left edge of the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/AIRBAG INDICATOR -

## AIRBAG CONTROL MODULE (Continued)

OPERATION). The ACM microprocessor continuously monitors all of the airbag system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault, it sets an active Diagnostic Trouble Code (DTC) and sends messages to the EMIC over the PCI data bus to turn on the airbag indicator. If the airbag system fault is still present when the ignition switch is turned to the Off position, the DTC is stored in memory by the ACM. However, if a fault does not recur for a number of ignition cycles, the ACM will automatically erase the stored DTC.

The ACM also receives a resistor multiplexed input from the passenger airbag on/off switch and provides a control output for the Off indicator in the switch through a passenger airbag indicator driver circuit. If the passenger airbag on/off switch is set to the Off position, the ACM turns on the passenger airbag on/off switch Off indicator and will internally disable the passenger airbag from being deployed if an impact is detected that is sufficient for an airbag deployment. The ACM also turns on the on/off switch Off indicator for about seven seconds each time the ignition switch is turned to the On position as a bulb test. Following the bulb test, the ACM controls the status of the Off indicator based upon the resistance of the input from the on/off switch. The ACM will also set and/or store a DTC for faults it detects in the passenger airbag on/off switch circuits, and will turn on the airbag indicator in the EMIC if a fault has been detected.

The ACM receives battery current through two circuits, on a fused ignition switch output (run) circuit through a fuse in the fuse block, and on a fused ignition switch output (run-start) circuit through a second fuse in the fuse block. The ACM is grounded through a ground circuit and take out of the cross body wire harness. This take out has a single eyelet terminal connector secured by a ground screw to the right cowl side inner panel below the instrument panel in the passenger compartment. Therefore, the ACM is operational whenever the ignition switch is in the Start or On positions. The ACM also contains an energy-storage capacitor. When the ignition switch is in the Start or On positions, this capacitor is continually being charged with enough electrical energy to deploy the airbags for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup airbag system protection in case there is a loss of battery current supply to the ACM during an impact. The capacitor is only serviced as a unit with the ACM.

Two sensors are contained within the ACM, an electronic impact sensor and a safing sensor. The electronic impact sensor is an accelerometer that senses the rate of vehicle deceleration, which pro-

vides verification of the direction and severity of an impact. A pre-programmed decision algorithm in the ACM microprocessor determines when the deceleration rate as signaled by the impact sensor indicates an impact that is severe enough to require airbag system protection. When the programmed conditions are met, the ACM sends an electrical signal to deploy the airbags and, on quad cab models, the seat belt tensioners. The safing sensor is an electromechanical sensor within the ACM that is connected in series between the ACM microprocessor deployment circuit and the airbags/seat belt tensioners. The safing sensor is a normally open switch that is used to verify or confirm the need for an airbag deployment by detecting impact energy of a lesser magnitude than that of the electronic impact sensor, and must be closed in order for the airbags to deploy. The impact sensor and safing sensor are calibrated for the specific vehicle, and are only serviced as a unit with the ACM.

## REMOVAL

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: THE AIRBAG CONTROL MODULE CONTAINS THE IMPACT SENSOR, WHICH ENABLES THE SYSTEM TO DEPLOY THE AIRBAGS. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.**

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Pull the carpet on the right and left sides of the floor panel transmission tunnel rearward far

## AIRBAG CONTROL MODULE (Continued)

enough to access the Airbag Control Module (ACM), which is forward of the floor console.

(3) If the vehicle is equipped with the optional Anti-lock Brake System (ABS), remove the acceleration switch from the left side of the mounting bracket on the floor panel transmission tunnel. (Refer to 5 - BRAKES/ELECTRICAL/G-SWITCH - REMOVAL).

(4) Remove the four screws that secure the Airbag Control Module (ACM) to the mounting bracket that is welded onto the floor panel transmission tunnel (Fig. 6).

80bf8d42

**Fig. 6 Airbag Control Module Remove/Install**

- 1 - SCREW (4)
- 2 - AIRBAG CONTROL MODULE
- 3 - WIRE HARNESS CONNECTOR
- 4 - MOUNTING BRACKET
- 5 - FRONT FLOOR PANEL

(5) Lift the ACM upward from the mounting bracket far enough to disengage the locator pins on the ACM housing from the locator holes in the mounting bracket, then pull the ACM out from under the instrument panel far enough to access the wire harness connector.

(6) Disconnect the cross body wire harness connector for the ACM from the ACM connector receptacle. To disconnect the cross body wire harness connector from the ACM (Fig. 7):

(a) Pull the white Connector Positive Assurance (CPA) locks on each side of the connector out about 3 millimeters (0.125 in.).

(b) Squeeze the latch tabs on each side of the connector between the thumb and forefinger and pull the connector straight away from the ACM connector receptacle.

(7) Remove the ACM from beneath the instrument panel.

80a82ce7

**Fig. 7 Airbag Control Module Connector Removal**

- 1 - AIRBAG CONTROL MODULE
- 2 - PULL TWO LOCKS OUT
- 3 - SQUEEZE LATCHES
- 4 - PULL
- 5 - PULL
- 6 - SQUEEZE LATCHES
- 7 - WIRE HARNESS CONNECTOR

## INSTALLATION

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## AIRBAG CONTROL MODULE (Continued)

**WARNING: THE AIRBAG CONTROL MODULE CONTAINS THE IMPACT SENSOR, WHICH ENABLES THE SYSTEM TO DEPLOY THE AIRBAGS. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.**

(1) Position the Airbag Control Module (ACM) beneath the instrument panel.

(2) Reconnect the cross body wire harness connector for the ACM to the ACM connector receptacle (Fig. 7). Be certain that the connector latches and the white Connector Positive Assurance (CPA) locks are fully engaged.

(3) Carefully position the ACM to the mounting bracket that is welded onto the floor panel transmission tunnel (Fig. 6). When the ACM is correctly positioned, the locator pins on the ACM housing will be engaged in the locator holes in the mounting bracket, and the arrow on the ACM label will be pointed forward in the vehicle.

(4) Install and tighten the four screws that secure the ACM to the mounting bracket welded onto the floor panel transmission tunnel. Tighten the screws to 14 N·m (125 in. lbs.).

(5) If the vehicle is equipped with the optional ABS brakes, reinstall the acceleration switch onto the left side of the mounting bracket on the floor panel transmission tunnel. (Refer to 5 - BRAKES/ELECTRICAL/G-SWITCH - INSTALLATION).

(6) Restore the carpet on the right and left sides of the floor panel transmission tunnel to its proper position beneath the instrument panel.

(7) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

**Fig. 8 Clockspring**

- 1 - LOCKING PIN
- 2 - ROTOR FLATS
- 3 - CASE
- 4 - UPPER CLOCKSPRING PIGTAIL WIRES (WIRES NOT SHOWN)
- 5 - ROTOR
- 6 - INDEX HOLE

two connector receptacles that face toward the instrument panel. Within the plastic housing is a spool-like molded plastic rotor with a large exposed hub. The upper surface of the rotor hub has a large center hole, two large flats, and two or three short pigtail wires with connectors. The third pigtail wire is used on vehicles equipped with the optional speed control system. The lower surface of the rotor hub has a molded plastic turn signal cancel cam consisting of two lobes that are molded into the rotor. Within the plastic case and wound around the rotor spool is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at the connector receptacles that face the instrument panel, while the inner end of the tape terminates at the pigtail wires on the hub of the clockspring rotor that face the steering wheel.

Service replacement clocksprings are shipped pre-centered and with a locking pin that snaps into a receptacle on the rotor and is engaged between two tabs on the upper surface of the rotor case. The locking pin secures the centered clockspring rotor to the clockspring case during shipment, but the locking pin must be removed from the clockspring after it is installed on the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STAN-

## CLOCKSPRING

### DESCRIPTION

The clockspring assembly is secured with two integral plastic latches onto the steering column lock housing near the top of the steering column behind the steering wheel (Fig. 8). The clockspring consists of a flat, round molded plastic case with a stubby tail that hangs below the steering column and contains

## CLOCKSPRING (Continued)

## DARD PROCEDURE - CLOCKSPRING CENTERING).

The clockspring cannot be repaired. If the clockspring is faulty, damaged, or if the driver airbag has been deployed, the clockspring must be replaced.

## OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed cross body wire harness on the steering column and the electrical components mounted on or in the rotating steering wheel. On this model the rotating electrical components include the driver airbag, the horn switch, and the speed control switches if the vehicle is so equipped. The clockspring case is positioned and secured to the upper steering column housing near the top of the steering column. The connector receptacles on the tail of the fixed clockspring case connect the clockspring to the vehicle electrical system through two take outs with connectors from the cross body wire harness. The clockspring rotor is movable and is keyed by two flats molded into the rotor hub to two flats that are cast into the lower surface of the steering wheel armature. The two lobes on the turn signal cancel cam on the lower surface of the clockspring rotor hub contact a turn signal cancel actuator of the multi-function switch to provide automatic turn signal cancellation. The pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the driver airbag, the horn switch, and the steering wheel wire harness for the two speed control switches if the vehicle is so equipped.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool can change position relative to the movable steering components and must be re-centered following completion of the service or the tape may be damaged. Service replacement clocksprings are shipped pre-centered and with a plastic locking pin installed. This locking pin should not be disengaged until the clockspring has been installed on the steering column. If the locking pin is removed or damaged before the clockspring is installed on a steering column, the clockspring centering procedure must be performed. (Refer to 8 - ELECTRICAL/RE-

STRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

## STANDARD PROCEDURE - CLOCKSPRING CENTERING

The clockspring is designed to wind and unwind when the steering wheel is rotated, but is only designed to rotate the same number of turns (about five complete rotations) as the steering wheel can be turned from stop to stop. Centering the clockspring indexes the clockspring tape to other steering components so that it can operate within its designed travel limits. The rotor of a centered clockspring can be rotated two and one-half turns in either direction from the centered position, without damaging the clockspring tape.

However, if the clockspring is removed for service or if the steering column is disconnected from the steering gear, the clockspring tape can change position relative to the other steering components. The clockspring must then be re-centered following completion of such service or the clockspring tape may be damaged. Service replacement clocksprings are shipped pre-centered and with a plastic locking pin installed (Fig. 9). This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring centering procedure must be performed.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE:** Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

- (1) Place the front wheels in the straight-ahead position.
- (2) Remove the clockspring from the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).
- (3) Rotate the clockspring rotor clockwise to the end of its travel. **Do not apply excessive torque.**

## CLOCKSPRING (Continued)

80b76eff

**Fig. 9 Clockspring**

- 1 - LOCKING PIN
- 2 - ROTOR FLATS
- 3 - CASE
- 4 - UPPER CLOCKSPRING PIGTAIL WIRES (WIRES NOT SHOWN)
- 5 - ROTOR
- 6 - INDEX HOLE

(4) From the end of the clockwise travel, rotate the rotor about two and one-half turns counterclockwise, until the rotor flats are horizontal. If the clockspring pigtail wires are not oriented towards the bottom of the clockspring, rotate the rotor another one-half turn in the counterclockwise direction.

(5) The clockspring is now centered. Lock the clockspring rotor to the clockspring case to maintain clockspring centering until it is reinstalled on the steering column. This can be done by inserting a stiff wire through the small index hole located at about the 11 o'clock position in the centered clockspring rotor and case. Bend the wire over after it has been inserted through the index hole to prevent it from falling out.

(6) The front wheels should still be in the straight-ahead position. Reinstall the clockspring onto the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

**REMOVAL**

The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL,**

**STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE:** Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

(1) Place the front wheels in the straight-ahead position.

(2) Remove the driver airbag from the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(3) If the vehicle is so equipped, disconnect the upper clockspring pigtail wire connector from the steering wheel wire harness for the speed control switches located within the hub cavity of the steering wheel.

(4) Remove the screw that secures the steering wheel armature to the steering column upper shaft, which is located within the hub cavity of the steering wheel.

**CAUTION:** Be certain that the screws that secure the steering wheel puller to the steering wheel are fully engaged in the steering wheel armature without passing through the steering wheel and damaging the clockspring.

(5) Pull the steering wheel off of the steering column upper shaft spline using a steering wheel puller (Special Tool C-3428-B).

(6) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(7) Remove the two screws that secure the lower steering column shroud to the upper shroud (Fig. 10).

(8) If the vehicle is equipped with the optional tilt steering column, move the tilt steering column to the fully lowered position and leave the tilt release lever in the released (down) position.

(9) Remove both the upper and lower shrouds from the steering column.

(10) Disconnect the two cross body wire harness connectors from the lower clockspring connector receptacles (Fig. 11).

## CLOCKSPRING (Continued)

- 2 - LATCHES
- 3 - CROSS BODY WIRE HARNESS
- 4 - LEFT MULTI-FUNCTION SWITCH
- 5 - SWITCH HOUSING
- 6 - STEERING COLUMN
- 7 - RIGHT MULTI-FUNCTION SWITCH

(11) Using a small screwdriver, gently pry both plastic latches of the clockspring assembly to release them from the steering column upper housing.

**NOTE:** If the clockspring plastic latches are broken, be certain to remove the broken pieces from the steering column upper housing.

(12) Remove the clockspring from the steering column. The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.

(13) If the removed clockspring is to be reused, lock the clockspring rotor to the clockspring case to maintain clockspring centering until it is reinstalled on the steering column. This can be done by inserting a stiff wire through the small index hole located at about the 11 o'clock position in the centered clockspring rotor and case. Bend the wire over after it has been inserted through the index hole to prevent it from falling out. If clockspring centering is not maintained, the clockspring must be centered again before it is reinstalled. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

**INSTALLATION**

The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.

If the clockspring is not properly centered in relation to the steering wheel, steering shaft and steering gear, it may be damaged. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING). Service replacement clocksprings are shipped pre-centered and with a plastic locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring centering procedure must be performed.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## CLOCKSPRING (Continued)

**NOTE:** Before starting this procedure, be certain that the front wheels are still in the straight-ahead position.

(1) If the removed clockspring is being reinstalled, remove the wire from the index hole that is locking the clockspring rotor to the clockspring case to maintain clockspring centering.

(2) Be certain that the left multi-function switch control stalk is in the neutral position, then carefully slide the centered clockspring down over the steering column upper shaft until both the upper and lower clockspring latches engage the steering column upper housing (Fig. 11).

(3) Reconnect the two cross body wire harness connectors to the lower clockspring connector receptacles.

(4) Position both the upper and lower shrouds onto the steering column (Fig. 10). Be certain that the locating tabs for the left and right multi-function switch control stalk watershields are properly engaged in the openings of both the upper and lower shrouds.

(5) Install and tighten the two screws that secure the lower steering column shroud to the upper shroud. Tighten the screws to 2 N·m (18 in. lbs.).

(6) If the vehicle is equipped with the optional tilt steering column, move the tilt steering column to the fully raised position and secure it in place by moving the tilt release lever back to the locked (up) position.

(7) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(8) If a new clockspring has been installed, remove the locking pin that is securing the clockspring rotor to the clockspring case to maintain clockspring centering.

(9) Reinstall the steering wheel onto the steering column upper shaft. Be certain to index the flats on the hub of the steering wheel with the formations on the inside of the clockspring rotor. Pull the upper clockspring pigtail wires through the lower hole in the steering wheel armature.

(10) Install and tighten the screw that secures the steering wheel to the steering column upper shaft. Tighten the screw to 54 N·m (40 ft. lbs.). Be certain not to pinch the clockspring pigtail wires or the steering wheel wire harness between the steering wheel and the screw.

(11) If the vehicle is so equipped, reconnect the upper clockspring pigtail wire connector to the steering wheel wire harness for the speed control switches.

(12) Reinstall the driver airbag onto the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

## DRIVER AIRBAG

## DESCRIPTION

80ab88a4

**Fig. 12 Driver Airbag - Typical**

- 1 - UPPER RETAINER
- 2 - AIRBAG HOUSING
- 3 - NUT (4)
- 4 - RETAINER SLOTS
- 5 - LOWER RETAINER
- 6 - TRIM COVER
- 7 - STUDS (4)
- 8 - INFLATOR

The driver airbag protective trim cover is the most visible part of the driver airbag (Fig. 12). The airbag used in this model is a Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The driver airbag is located in the center of the steering wheel, where it is secured with two screws to the steering wheel armature. Concealed beneath the driver airbag trim cover are the horn switch, the folded airbag cushion, the airbag retainer or housing, the airbag inflator, and the retainers that secure the trim cover to the airbag housing. The resistive membrane-type horn switch is secured with heat stakes to the inside surface of the driver airbag trim cover, between the trim cover and the folded airbag cushion. The airbag inflator is a conventional pyrotechnic-type unit that is secured with nuts to four studs on the back of the stamped metal airbag housing.

The driver airbag trim cover has locking blocks molded into the back side of it that engage a lip formed around the perimeter of the airbag housing. Two stamped metal retainers then fit over the inflator mounting studs on the back of the airbag housing and are engaged in slots on the inside of the trim cover, securely locking the cover into place. One horn switch pigtail wire has an eyelet terminal connector

## DRIVER AIRBAG (Continued)

that is captured on the upper left inflator mounting stud between the inflator and the upper trim cover retainer. The other horn switch pigtail wire is routed between the upper right inflator stud and the inflator, then secured with a small nylon retainer that is pressed onto the inflator stud. The driver airbag cannot be repaired, and must be replaced if deployed or in any way damaged. The driver airbag trim cover and the horn switch are available as a unit and may be disassembled from the driver airbag for service replacement.

## OPERATION

The driver airbag is deployed by an electrical signal generated by the Airbag Control Module (ACM) through the driver airbag line 1 and line 2 (or squib) circuits. When the ACM sends the proper electrical signal to the airbag inflator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn, ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of nitrogen gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the nitrogen gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver airbag trim cover will split at predetermined break-out lines, then fold back out of the way along with the horn switch. Following an airbag deployment, the airbag cushion quickly deflates by venting the nitrogen gas towards the instrument panel through the porous fabric material used on the steering wheel side of the airbag cushion.

Some of the chemicals used to create the nitrogen gas are considered hazardous in their solid state, before they are burned, but they are securely sealed within the airbag inflator. However, the nitrogen gas that is produced when the chemicals are burned is harmless. A small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noticed, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breathe. If the irritation is not alleviated by these actions, contact a physician.

## REMOVAL

The following procedure is for replacement of a faulty or damaged driver airbag. If the driver airbag has been deployed, the clockspring must also be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL,**

**STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: WHEN REMOVING A DEPLOYED AIRBAG, RUBBER GLOVES, EYE PROTECTION, AND A LONG-SLEEVED SHIRT SHOULD BE WORN. THERE MAY BE DEPOSITS ON THE AIRBAG CUSHION AND OTHER INTERIOR SURFACES. IN LARGE DOSES, THESE DEPOSITS MAY CAUSE IRRITATION TO THE SKIN AND EYES.**

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) From the underside of the steering wheel, remove the two screws that secure the driver airbag to the steering wheel armature (Fig. 13).

80a4a584

**Fig. 13 Driver Airbag Remove/Install - Typical**

- 1 - STEERING WHEEL
- 2 - DRIVER AIRBAG
- 3 - CLOCKSPRING PIGTAIL WIRE (HORN SWITCH)
- 4 - CLOCKSPRING PIGTAIL WIRE (AIRBAG)
- 5 - CLOCKSPRING
- 6 - SCREW (2)

(3) Pull the driver airbag away from the steering wheel far enough to access the two wire harness connectors on the back of the airbag.

(4) Disconnect the clockspring horn switch pigtail wire connector from the switch feed pigtail wire connector, which is located on the back of the driver airbag.

## DRIVER AIRBAG (Continued)

**CAUTION:** Do not pull on the clockspring wire harness to disengage the connector from the driver airbag inflator connector receptacle.

(5) The clockspring driver airbag pigtail wire connector is a tight snap fit into the airbag inflator connector receptacle, which is located on the back of the driver airbag. Firmly grasp and pull or gently pry on the clockspring driver airbag pigtail wire connector to disconnect it from the airbag inflator connector receptacle.

(6) Remove the driver airbag from the steering wheel.

(7) If the driver airbag has been deployed, the clockspring must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

## DISASSEMBLY

The horn switch is integral to the driver airbag trim cover. If either component is faulty or damaged, the entire driver airbag trim cover and horn switch unit must be replaced.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: THE HORN SWITCH IS INTEGRAL TO THE DRIVER AIRBAG UNIT. SERVICE OF THIS UNIT SHOULD BE PERFORMED ONLY BY DAIMLERCHRYSLER-TRAINED AND AUTHORIZED DEALER SERVICE TECHNICIANS. FAILURE TO TAKE THE PROPER PRECAUTIONS OR TO FOLLOW THE PROPER PROCEDURES COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.**

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Remove the driver airbag from the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(3) Remove the plastic horn switch pigtail wire retainer from the stud on the back of the driver airbag housing (Fig. 14).

80ab88a3

**Fig. 14 Horn Switch Feed Wire Remove/Install**

- 1 - HORN SWITCH FEED PIGTAIL WIRE
- 2 - HORN SWITCH GROUND PIGTAIL WIRE
- 3 - RETAINER

(4) Remove the four nuts that secure the upper and lower trim cover retainers to the studs on the back of the driver airbag housing (Fig. 15).

80ab88a4

**Fig. 15 Driver Airbag Trim Cover**

- 8 - INFLATOR

(5) Remove the upper and lower trim cover retainers from the airbag housing studs.

## DRIVER AIRBAG (Continued)

(6) Remove the horn switch ground pigtail wire eyelet terminal connector from the upper left airbag housing stud.

(7) Disengage the four trim cover locking blocks from the lip around the outside edge of the driver airbag housing and remove the housing from the cover (Fig. 16).

80ab88a6

**Fig. 16 Driver Airbag Trim Cover Remove/Install**

- 1 - RETAINER SLOTS
- 2 - TRIM COVER
- 3 - LOCKING BLOCKS
- 4 - RETAINER SLOTS
- 5 - HORN SWITCH

## ASSEMBLY

The horn switch is integral to the driver airbag trim cover. If either component is faulty or damaged, the entire driver airbag trim cover and horn switch unit must be replaced.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: THE HORN SWITCH IS INTEGRAL TO THE DRIVER AIRBAG UNIT. SERVICE OF THIS UNIT SHOULD BE PERFORMED ONLY BY DAIMLERCHRYSLER-TRAINED AND AUTHORIZED**

**DEALER SERVICE TECHNICIANS. FAILURE TO TAKE THE PROPER PRECAUTIONS OR TO FOLLOW THE PROPER PROCEDURES COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.**

**WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE DRIVER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE DRIVER AIRBAG CUSHION AND THE DRIVER AIRBAG TRIM COVER. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

**WARNING: THE DRIVER AIRBAG TRIM COVER MUST NEVER BE PAINTED. REPLACEMENT TRIM COVERS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE TRIM COVER RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

(1) Carefully position the driver airbag in the trim cover. Be certain that the horn switch feed and ground pigtail wires are not pinched between the airbag housing and the trim cover locking blocks.

(2) Engage the upper and lower trim cover locking blocks with the lip of the driver airbag housing, then engage the locking blocks on each side of the trim cover with the lip of the housing. Be certain that each of the locking blocks is fully engaged on the lip of the airbag housing (Fig. 17).

(3) Reinstall the horn switch ground pigtail wire eyelet terminal connector over the left upper airbag housing stud.

(4) Reinstall the upper and lower airbag trim cover retainers over the airbag housing studs. Be certain that the tabs on each retainer are engaged in the retainer slots of the upper and lower trim cover locking blocks (Fig. 16).

(5) Install and tighten the nuts that secure the trim cover retainers to the airbag housing studs. Tighten the nuts to 10 N·m (90 in. lbs.).

(6) Reinstall the driver airbag onto the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

## DRIVER AIRBAG (Continued)

80a0f19f

**Fig. 17 Driver Airbag Trim Cover Locking Blocks Engaged**

- 1 - LIP
- 2 - TRIM COVER
- 3 - HORN SWITCH

- 5 - LOCKING BLOCK

**INSTALLATION**

The following procedure is for replacement of a faulty or damaged driver airbag. If the driver airbag has been deployed, the clockspring must also be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE DRIVER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE DRIVER AIRBAG CUSHION AND THE DRIVER AIRBAG TRIM COVER. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

**WARNING: THE DRIVER AIRBAG TRIM COVER MUST NEVER BE PAINTED. REPLACEMENT TRIM COVERS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE TRIM COVER RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

(1) Assemble the driver airbag trim cover onto the airbag housing. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - ASSEMBLY).

(2) When installing the driver airbag, reconnect the clockspring driver airbag pigtail wire connector to the airbag module connector receptacle by pressing straight in on the connector (Fig. 13). You can be certain that the connector is fully engaged by listening carefully for a distinct, audible click as the connector snaps into place.

(3) Reconnect the clockspring pigtail wire connector for the horn switch to the switch feed pigtail wire connector, which is located on the back of the driver airbag.

(4) Carefully position the driver airbag in the steering wheel. Be certain that the clockspring and steering wheel wire harnesses in the steering wheel hub area are not pinched between the driver airbag and the steering wheel.

(5) From the underside of the steering wheel, install and tighten the two screws that secure the driver airbag to the steering wheel armature. Tighten the screws to 10 N·m (90 in. lbs.).

(6) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

## FRONT SEAT BELT & RETRACTOR

### REMOVAL

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Move the front seats to their most forward position for easiest access to the front shoulder belt lower anchor screw, the belt retractor and the sport bar.

(2) Unsnap and lift the front shoulder belt turning loop cover to access the screw that secures the turning loop to the height adjuster near the top of the sport bar (Fig. 18).

**Fig. 18 Front Shoulder Belt Turning Loop**

- 1 - HEIGHT ADJUSTER
- 2 - SPORT BAR
- 3 - TRIM COVER
- 4 - TURNING LOOP

(3) Remove the screw that secures the shoulder belt turning loop to the adjuster.

(4) Remove the shoulder belt turning loop and the support/guide washer from the adjuster.

(5) Remove the screw that secures the retractor and lower seat belt anchor plate to the sport bar near its base (Fig. 19).

**Fig. 19 Front Shoulder Belt and Retractor - Typical**

- 1 - SPORT BAR
- 2 - RETRACTOR

(6) Remove the front seat shoulder belt and retractor from the sport bar.

### INSTALLATION

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Position the front seat shoulder belt and retractor near the base of the sport bar (Fig. 19). Be certain to engage the locator tab on the retractor in the locator hole on the sport bar.

(2) Install and tighten the screw that secures the retractor and lower seat belt anchor plate to the sport bar. Tighten the screw to 43 N·m (32 ft. lbs.).

## FRONT SEAT BELT &amp; RETRACTOR (Continued)

(3) Position the support/guide washer and the shoulder belt turning loop onto the height adjuster near the top of the sport bar (Fig. 18).

(4) Install and tighten the screw that secures the shoulder belt turning loop to the adjuster. Tighten the screw to 43 N·m (32 ft. lbs.).

(5) Fold and snap the shoulder belt turning loop cover back into place over the screw that secures the turning loop to the adjuster.

## FRONT SEAT BELT BUCKLE

## REMOVAL

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) On the driver side only, disconnect the seat belt switch pigtail wire connector from the body wire harness connector for the seat belt switch (Fig. 20).

(2) Remove the screw that secures the seat belt buckle to the bracket on the rear of the upper inner front seat track (Fig. 21).

(3) Remove the seat belt buckle from the seat track bracket.

## INSTALLATION

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. **RECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Position the seat belt buckle to the bracket on the rear of the upper inner front seat track.

(2) Install and tighten the screw that secures the seat belt buckle to the seat track bracket (Fig. 21). Tighten the screw to 43 N·m (32 ft. lbs.).

(3) On the driver side only, reconnect the seat belt switch pigtail wire connector to the body wire harness connector for the seat belt switch (Fig. 20).

## PASSENGER AIRBAG

## DESCRIPTION

The passenger airbag door on the instrument panel above the glove box is the most visible part of the passenger airbag. The airbag used in this model is a Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The passenger airbag is located in the instrument panel in front of the front seat passenger seating position, where it is secured with nuts to three weld studs on the instrument panel structural support and two weld studs on the dash panel. Concealed beneath the passenger airbag door are the folded airbag cushion, the airbag retainer or housing, and the airbag inflator. The airbag inflator is a hybrid-type unit that is secured to

## PASSENGER AIRBAG (Continued)

**Fig. 21 Seat Belt Buckle**

- 1 - SEAT CUSHION
- 2 - SEAT BACK
- 3 - TRIM ATTACHMENT WIRES
- 4 - SEAT TRACK
- 5 - SEAT RISER
- 6 - SEATBELT BUCKLE

and sealed within the stamped metal airbag housing along with the folded airbag cushion. A yellow connector on the end of a short, two-wire pigtail harness connects the passenger airbag inflator to the vehicle electrical system.

The molded plastic passenger airbag door also serves as a trim cover and has two flanges and a stamped metal bracket that secure it in place. The two flanges are secured with screws to the top of the instrument panel structural support and the upper glove box opening reinforcement. The stamped metal bracket is secured to the back of the instrument panel structural support with two screws, and also serves as the passenger airbag door hinge. Following a passenger airbag deployment, the passenger airbag and the passenger airbag door must be replaced. The passenger airbag cannot be repaired, and must be replaced if faulty or in any way damaged. The passenger airbag door can be disassembled from the instrument panel and replaced as a separate service item.

**OPERATION**

The passenger airbag is deployed by an electrical signal generated by the Airbag Control Module (ACM) through the passenger airbag line 1 and line 2

(or squib) circuits. The hybrid-type inflator assembly includes a small canister of highly compressed argon gas. When the ACM sends the proper electrical signal to the airbag inflator, the electrical energy generates enough heat to ignite chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce the pressure necessary to rupture a containment disk in the argon gas canister. The inflator and argon gas canister are sealed to the airbag cushion so that all of the released argon gas is directed into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door will split at predetermined breakout lines, then fold back over the top of the instrument panel and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the argon gas through the porous fabric material used on each end panel of the airbag cushion.

Some of the chemicals used to create the pressure to burst the argon gas containment disk are considered hazardous in their solid state, before they are burned, but they are securely sealed within the airbag inflator. However, the gas that is produced when the chemicals are burned is harmless. A small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noticed, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician immediately.

**REMOVAL**

The following procedure is for replacement of a faulty or damaged passenger airbag. If the passenger airbag has been deployed, the instrument panel assembly must be replaced. Replacement instrument panels include the passenger airbag and the passenger airbag door. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## PASSENGER AIRBAG (Continued)

**WARNING: WHEN REMOVING A DEPLOYED AIRBAG, RUBBER GLOVES, EYE PROTECTION, AND A LONG-SLEEVED SHIRT SHOULD BE WORN. THERE MAY BE DEPOSITS ON THE AIRBAG UNIT AND OTHER INTERIOR SURFACES. IN LARGE DOSES, THESE DEPOSITS MAY CAUSE IRRITATION TO THE SKIN AND EYES.**

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Remove the instrument panel from the passenger compartment of the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Place the instrument panel on a suitable work surface. Be certain to take the proper precautions to protect the instrument panel from any possible cosmetic damage.

(4) Remove the three nuts that secure the passenger airbag to the weld studs on the instrument panel structural support (Fig. 22).

**Fig. 22 Passenger Airbag Remove/Install**

- 1 - STRUCTURAL SUPPORT
- 2 - NUT (3)
- 3 - PASSENGER AIRBAG

(5) Remove the passenger airbag from the instrument panel structural support.

## INSTALLATION

The following procedure is for replacement of a faulty or damaged passenger airbag. If the passenger airbag has been deployed, the instrument panel assembly must be replaced. Replacement instrument panels include the passenger airbag and the passenger airbag door. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR**

**THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: WHEN REMOVING A DEPLOYED AIRBAG, RUBBER GLOVES, EYE PROTECTION, AND A LONG-SLEEVED SHIRT SHOULD BE WORN. THERE MAY BE DEPOSITS ON THE AIRBAG UNIT AND OTHER INTERIOR SURFACES. IN LARGE DOSES, THESE DEPOSITS MAY CAUSE IRRITATION TO THE SKIN AND EYES.**

**WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE PASSENGER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE PASSENGER AIRBAG CUSHION AND THE PASSENGER AIRBAG DOOR. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

**WARNING: THE PASSENGER AIRBAG DOOR MUST NEVER BE PAINTED. REPLACEMENT AIRBAG DOORS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE AIRBAG DOOR RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

(1) Carefully position the passenger airbag onto the weld studs on the instrument panel structural support (Fig. 22).

(2) Install and tighten the three nuts that secure the passenger airbag upper and lower mounting brackets to the weld studs on the instrument panel structural support. Tighten the nuts to 12 N·m (105 in. lbs.).

(3) Reinstall the instrument panel into the passenger compartment of the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION). When installing the instrument panel, be certain to reconnect the passenger airbag pigtail wire connector to the cross body wire harness, and that the connector is fully engaged and latched.

(4) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

## PASSENGER AIRBAG ON / OFF SWITCH

### DESCRIPTION

**Fig. 23 Passenger Airbag On/Off Switch**

- 1 - PASSENGER AIRBAG ON/OFF SWITCH
- 2 - LABEL
- 3 - FLOOR CONSOLE
- 4 - WIRE HARNESS CONNECTOR

The passenger airbag on-off switch is standard equipment on all versions of this model (Fig. 23). This switch is a two-position, resistor multiplexed switch with a single integral red Light-Emitting Diode (LED), and a non-coded key cylinder-type actuator. The switch is located on the forward end of the floor console (both full and mini versions) to make the Off indicator visible to all front seat occupants. When the switch is in its installed position, the only components visible through the dedicated opening of the console switch bezel is the key cylinder actuator. A small, tethered, molded plastic cap fits into the key cylinder actuator hole when the switch is not being used. The switch nomenclature and a lens are integral to the console switch bezel. When the switch "Off" position is selected with the ignition switch in the On position, the LED illuminates the text "Off" in amber in the console switch bezel. The "On" position of the switch is designated by text imprinted upon the console switch bezel, but is not illuminated. The remainder of the switch is concealed behind the console switch bezel.

The passenger airbag on-off switch housing is constructed of molded plastic and has three integral mounting tabs. These mounting tabs are used to secure the switch to the back of the molded plastic console switch bezel with three small screws. The console switch bezel has four molded plastic snap features that are used to secure the switch and bezel unit to the floor console. A molded plastic connector receptacle on the back of the switch housing connects the switch to the vehicle electrical system through a dedicated take out of the cross body wire harness. The harness take out is equipped with a molded plastic connector insulator that is keyed and latched to ensure proper and secure switch electrical connections. The passenger airbag on/off switch cannot be adjusted or repaired and, if faulty or damaged, the switch must be replaced.

### OPERATION

The passenger airbag on-off switch allows the customer to turn the passenger airbag function On or Off to accommodate certain uses of the right front seating position where airbag protection may not be desired. See the owner's manual in the vehicle glove box for specific recommendations on when to enable or disable the passenger airbag. The Off indicator of the switch will be illuminated whenever the switch is turned to the Off position and the ignition switch is in the On position. The ignition key is the only key or object that should ever be inserted into the key cylinder actuator of the switch. The on-off switch requires only a partial key insertion to fully depress a spring-loaded locking plunger. The spring-loaded locking plunger prevents the user from leaving the key in the switch. The key will be automatically ejected when force is not applied. To actuate the passenger side airbag on/off switch, insert the ignition key into the switch key actuator far enough to fully depress the plunger, and rotate the actuator to the desired switch position. When the switch key actuator is rotated to its clockwise stop (the key actuator slot will be aligned with the Off indicator), the Off indicator is illuminated and the passenger airbag is disabled. When the switch is rotated to its counter-clockwise stop (the key actuator slot will be in a vertical position), the Off indicator will be extinguished and the passenger airbag is enabled.

The passenger airbag on/off switch connects one of two internal resistors in series between the passenger airbag mux switch sense and passenger airbag mux switch return circuits of the Airbag Control Module (ACM). The ACM continually monitors the resistance in these circuits to determine the switch position that has been selected. When the switch is in the Off position, the ACM provides a ground input to the switch through the passenger airbag indicator

## PASSENGER AIRBAG ON / OFF SWITCH (Continued)

driver circuit, which energizes the Light-Emitting Diode (LED) that illuminates the Off indicator of the switch. The ACM will also illuminate the Off indicator of the switch for about seven seconds each time the ignition switch is turned to the On position as a bulb test. The ACM will store a Diagnostic Trouble Code (DTC) for any fault it detects in the passenger airbag on/off switch or Off indicator circuits, and will illuminate the airbag indicator in the instrument cluster if a fault is detected. For proper diagnosis of the passenger airbag on/off switch or the ACM, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

## REMOVAL

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry the console switch bezel away from the floor console far enough to release the four snap features that secure the bezel to the console (Fig. 24).

(3) Lift the console switch bezel away from the console far enough to access and disconnect the cross body wire harness connector for the passenger airbag on/off switch from the switch connector receptacle.

(4) Remove the passenger airbag on/off switch and console switch bezel unit from the floor console.

(5) From the underside of the console switch bezel, remove the three screws that secure the passenger airbag on/off switch to the back of the bezel.

(6) Remove the passenger airbag on/off switch from the console switch bezel.

## INSTALLATION

(1) Position the passenger airbag on/off switch to the underside of the console switch bezel.

(2) Install and tighten the three screws that secure the passenger airbag on/off switch to the back of the

80bf8daf

**Fig. 24 Passenger Airbag On/Off Switch Remove/Install**

- 1 - PASSENGER AIRBAG ON/OFF SWITCH
- 2 - LABEL
- 3 - FLOOR CONSOLE
- 4 - WIRE HARNESS CONNECTOR

console switch bezel. Tighten the screws to 2 N·m (20 in. lbs.).

(3) Position the passenger airbag on/off switch and console switch bezel unit to the mounting hole at the front of the floor console (Fig. 24).

(4) Reconnect the cross body wire harness connector for the passenger airbag on/off switch to the switch connector receptacle.

(5) Align the four snap features on the console switch bezel with the slots on either side of the mounting hole in the floor console.

(6) Using hand pressure, press down firmly and evenly on the console switch bezel until each of the four snap features is fully engaged in the slots on either side of the mounting hole in the floor console.

(7) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

## REAR SEAT BELT & RETRACTOR

### REMOVAL

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Slide both rear seat belt buckle units between the seat cushion and seat back into the cargo area.

(2) Lift the rear seat back release lever and fold the rear seat back forward, then tumble the folded rear seat cushion and back unit forward against the backs of the two front bucket seats.

(3) Remove the screw that secures the lower anchor plate of the rear seat shoulder belt to the inner rear wheel house panel (Fig. 25).

(4) Remove the rear seat shoulder belt lower anchor plate from the inner rear wheel house panel.

(5) Unsnap and lift the rear shoulder belt turning loop cover to access the screw that secures the turning loop anchor plate to the sport bar near the top of the bar (Fig. 26).

(6) Remove the screw that secures the shoulder belt turning loop anchor plate to the sport bar.

(7) Remove the shoulder belt turning loop anchor plate from the sport bar.

(8) Remove the screw that secures the retractor to the sport bar near the top of the inner rear wheel house panel.

(9) Remove the rear seat shoulder belt and retractor from the sport bar.

## REAR SEAT BELT &amp; RETRACTOR (Continued)

## INSTALLATION

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Position the rear seat shoulder belt and retractor to the sport bar near the top of the inner rear wheel house panel (Fig. 25). Be certain to engage the locator tab on the retractor in the locator hole on the sport bar.

(2) Install and tighten the screw that secures the retractor to the sport bar. Tighten the screw to 43 N·m (32 ft. lbs.).

(3) Position the rear shoulder belt turning loop anchor plate to the sport bar near the top of the bar (Fig. 26).

(4) Install and tighten the screw that secures the turning loop anchor plate to the sport bar. Tighten the screw to 43 N·m (32 ft. lbs.).

(5) Fold and snap the shoulder belt turning loop cover back into place over the screw that secures the turning loop to the sport bar.

(6) Position the rear seat shoulder belt lower anchor plate to the inner rear wheel house panel.

(7) Install and tighten the screw that secures the rear seat shoulder belt lower anchor plate to the inner rear wheel house panel. Tighten the screw to 43 N·m (32 ft. lbs.).

(8) Tumble the folded rear seat cushion and back unit rearward onto the rear floor panel.

(9) Slide both rear seat belt buckle units between the seat cushion and the seat back.

(10) Unfold the rear seat back from the seat cushion until the seat back latch is fully engaged.

## REAR SEAT BELT BUCKLE

## REMOVAL

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Slide both rear seat belt buckle units between the seat cushion and seat back into the cargo area.

(2) Lift the rear seat back release lever and fold the rear seat back forward, then tumble the folded rear seat cushion and back unit forward against the backs of the two front bucket seats.

(3) Lift the cargo area carpet between the two rear seat belt buckle units far enough to access and remove the screw that secures the anchor plate of the buckle units to the rear floor panel through one of the clearance slots in the carpet (Fig. 27).

80a450d0

**Fig. 27 Rear Seat Belt Buckles Remove/Install**

1 - REAR SEAT BELT BUCKLE UNIT

(4) Remove the rear seat belt buckle unit from the rear floor panel through one of the clearance slots in the cargo area carpet.

## REAR SEAT BELT BUCKLE (Continued)

## INSTALLATION

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Lift the cargo area carpet far enough to position the rear seat belt buckle unit onto the rear floor panel through one of the clearance slots in the carpet.

(2) Working through one of the clearance slots in the cargo area carpet, install and tighten the screw that secures the anchor plate of the rear seat belt buckle unit to the rear floor panel (Fig. 27). Tighten the screw to 43 N·m (32 ft. lbs.).

(3) Tumble the folded rear seat cushion and back unit rearward onto the rear floor panel.

(4) Slide both rear seat belt buckle units between the seat cushion and the seat back.

(5) Unfold the rear seat back from the seat cushion until the seat back latch is fully engaged.

## SEAT BELT SWITCH

## DESCRIPTION

The seat belt switch is a small, normally closed, single pole, single throw, leaf contact, momentary switch. Only one seat belt switch is installed in the vehicle, and it is integral to the buckle of the driver seat belt buckle-half, located between the inboard side of the driver side front seat and the floor panel transmission tunnel (Fig. 28). The seat belt switch is connected to the vehicle electrical system through a two-wire pigtail wire and connector on the seat belt buckle-half, which is connected to a wire harness connector and take out of the body wire harness routed along the left side of the body sill in the passenger compartment.

The seat belt switch cannot be adjusted or repaired and, if faulty or damaged, the entire driver seat belt buckle-half unit must be replaced.

80a136e7

**Fig. 28 Seat Belt Switch**

- 1 - WIRE HARNESS CONNECTOR
- 2 - DRIVER SEAT RISER
- 4 - FLOOR PANEL

## OPERATION

The seat belt switch is designed to control a path to ground for the seat belt switch sense input of the instrument cluster. When the driver side seat belt tip-half is inserted in the seat belt buckle, the switch opens the path to ground; and, when the driver side seat belt tip-half is removed from the seat belt buckle, the switch closes the ground path. The switch is actuated by the latch mechanism within the seat belt buckle.

The seat belt switch receives ground through its pigtail wire connection to the body wire harness from another take out of the body wire harness. An eyelet terminal connector on that ground take out is secured under a ground screw on the left cowl side inner panel, beneath the instrument panel. The seat belt switch is connected in series between ground and the seat belt switch sense input of the instrument cluster.

## DIAGNOSIS AND TESTING - SEAT BELT SWITCH

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## SEAT BELT SWITCH (Continued)

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable. Disconnect the seat belt switch pigtail wire connector from the body wire harness connector for the seat belt switch on the floor near the driver side seat belt buckle-half anchor. Check for continuity between the seat belt switch sense circuit and the ground circuit cavities of the seat belt switch pigtail wire connector. There should be continuity with the seat belt unbuckled, and no continuity with the seat belt buckled. If OK, go to Step 2. If not OK, replace the faulty seat belt buckle-half assembly.

(2) Check for continuity between the ground circuit cavity in the body wire harness connector for the seat belt switch and a good ground. There should be continuity. If OK, refer to for further diagnosis of the instrument cluster chime service input from the seat belt switch. If not OK, repair the open ground circuit to ground (G302) as required.

## SEAT BELT TURNING LOOP ADJUSTER

### REMOVAL

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

(1) Unsnap and lift the shoulder belt turning loop cover to access the screw that secures the turning loop to the adjuster (Fig. 29).

**Fig. 29 Front Turning Loop Height Adjuster**

- 1 - HEIGHT ADJUSTER
- 2 - SPORT BAR
- 3 - TRIM COVER
- 4 - TURNING LOOP

(2) Remove the screw that secures the shoulder belt turning loop to the adjuster.

(3) Remove the shoulder belt turning loop and the support/guide washer from the adjuster.

(4) Unsnap and remove the trim cover from the height adjuster.

(5) Remove the two screws that secure the turning loop adjuster to the sport bar.

(6) Remove the turning loop adjuster from the sport bar.

### INSTALLATION

**WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.**

## SEAT BELT TURNING LOOP ADJUSTER (Continued)

(1) Position the turning loop adjuster onto the sport bar (Fig. 29). Be certain that the word "Up" stamped on the adjuster is properly oriented.

(2) Install and tighten the two screws that secure the turning loop adjuster to the sport bar. Tighten the screws to 43 N·m (32 ft. lbs.).

(3) Align the trim cover over the height adjuster and, using hand pressure, press firmly and evenly on the cover until it snaps into place.

(4) Position the support/guide washer and the shoulder belt turning loop onto the adjuster.

(5) Install and tighten the screw that secures the shoulder belt turning loop to the adjuster. Tighten the screw to 43 N·m (32 ft. lbs.).

(6) Fold and snap the shoulder belt turning loop cover back into place over the screw that secures the turning loop to the adjuster.

WIRING DIAGRAM  
INFORMATIONDESCRIPTION - HOW TO USE WIRING  
DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

## SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

## WIRING DIAGRAM INFORMATION (Continued)

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP OF THE PAGE, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM OF THE PAGE.

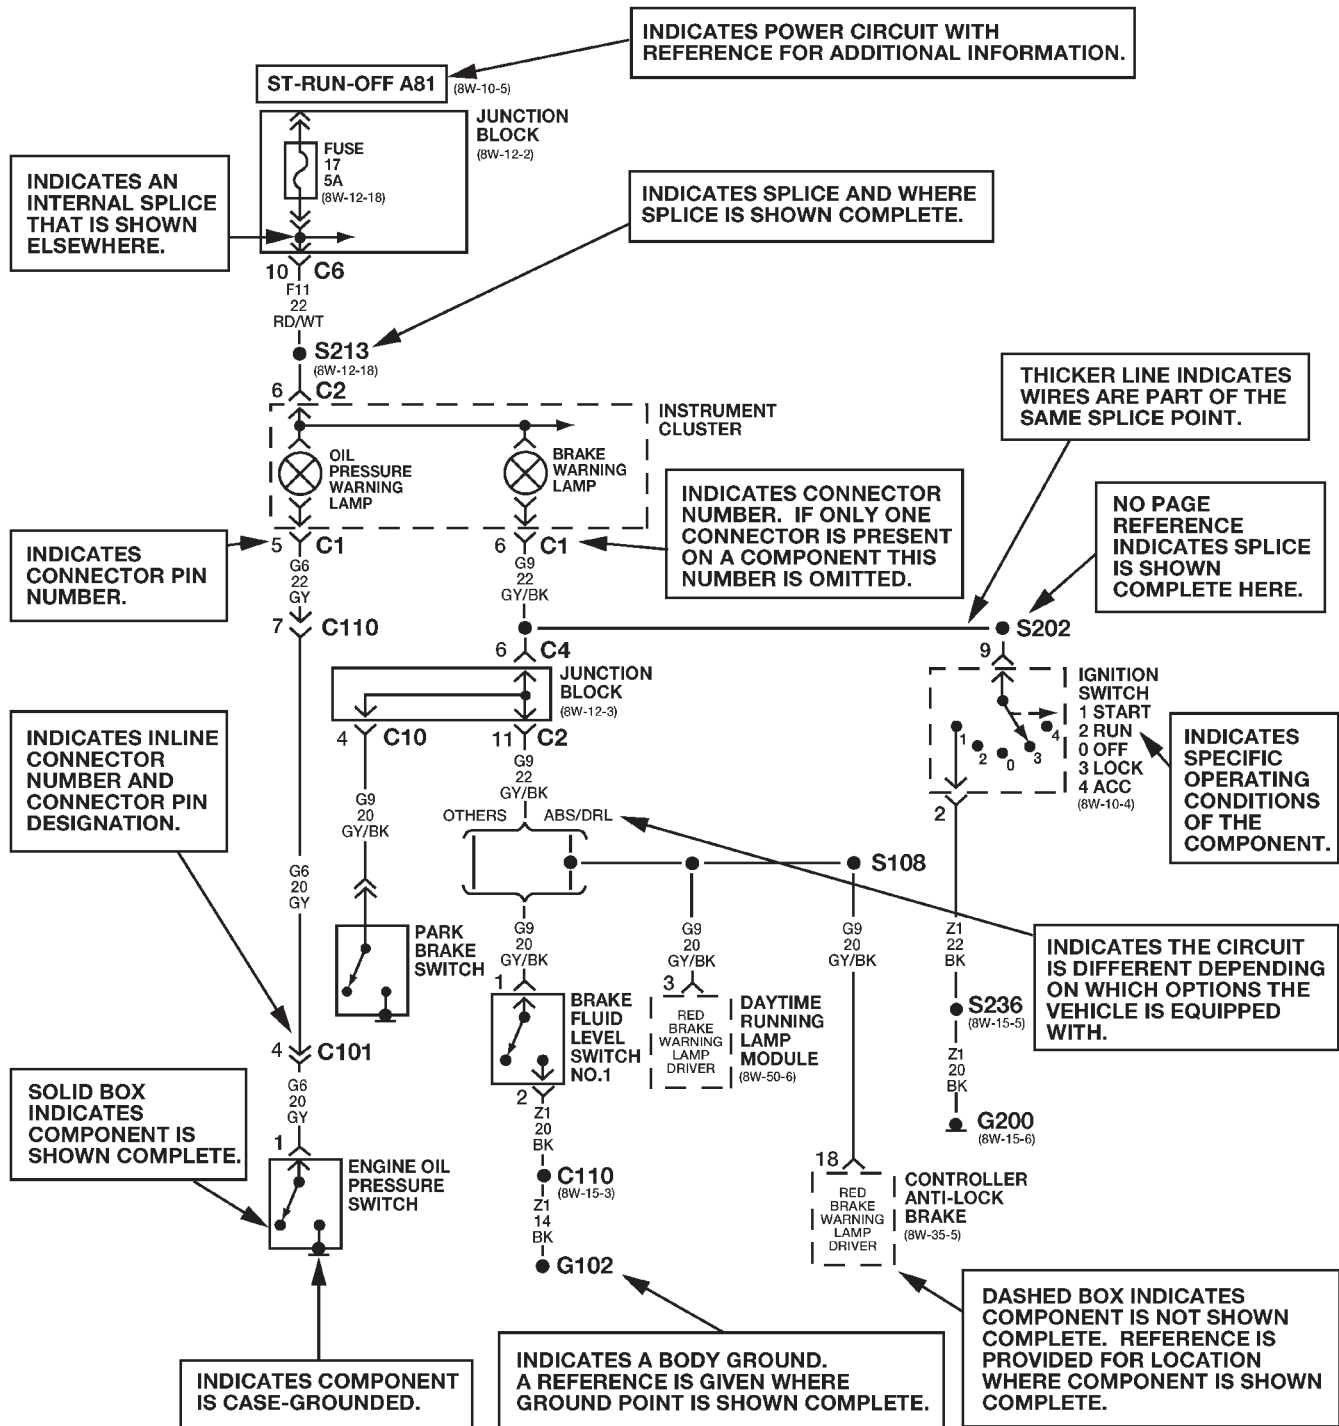

The System shown here is an **EXAMPLE ONLY**. It does not represent the actual circuit shown in the **WIRING DIAGRAM SECTION**.

**Fig. 1 WIRING DIAGRAM EXAMPLE 1**

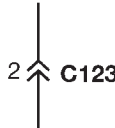

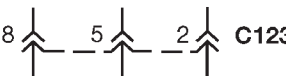

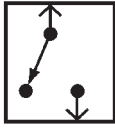

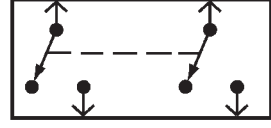

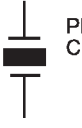

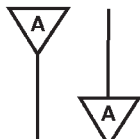

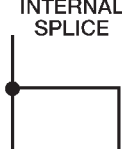

## WIRING DIAGRAM INFORMATION (Continued)

*The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM SECTION.*

**TERMINOLOGY**

This is a list of terms and definitions used in the wiring diagrams.

LHD ..... Left Hand Drive Vehicles  
RHD ..... Right Hand Drive Vehicles  
ATX .. Automatic Transmissions-Front Wheel Drive  
MTX .... Manual Transmissions-Front Wheel Drive  
AT .... Automatic Transmissions-Rear Wheel Drive  
MT ..... Manual Transmissions-Rear Wheel Drive  
SOHC ..... Single Over Head Cam Engine  
DOHC ..... Double Over Head Cam Engine  
Built-Up-Export ..... Vehicles Built For Sale In  
Markets Other Than North America  
Except-Built-Up-Export .. Vehicles Built For Sale In  
North America

**WARNINGS - GENERAL**

**WARNINGS** provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

**WARNING:: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.**

**WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.**

**WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.**

**WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.**

**WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.**

**WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.**

**WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIA-**

**TOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.**

**WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.**

**WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING.**

**DIAGNOSIS AND TESTING****DIAGNOSIS AND TESTING - WIRING HARNESS****TROUBLESHOOTING TOOLS**

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

**WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.**

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

**CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.**

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

**CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.**

## WIRING DIAGRAM INFORMATION (Continued)

• **Probing Tools** - These tools are used for probing terminals in connectors (Fig. 4). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

948W-233

**Fig. 4 PROBING TOOL**

- 1 - SPECIAL TOOL 6801  
2 - PROBING END

**INTERMITTENT AND POOR CONNECTIONS**

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

**TROUBLESHOOTING WIRING PROBLEMS**

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items,

disconnect them to verify these add-on items are not the cause of the problem.

- (1) Verify the problem.
- (2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.
- (3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
- (4) Isolate the problem area.
- (5) Repair the problem area.
- (6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

**STANDARD PROCEDURE****STANDARD PROCEDURE - TESTING FOR VOLTAGE POTENTIAL**

- (1) Connect the ground lead of a voltmeter to a known good ground (Fig. 5).
- (2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

948W-194

**Fig. 5 Testing for Voltage Potential**

## WIRING DIAGRAM INFORMATION (Continued)

**STANDARD PROCEDURE - TESTING FOR CONTINUITY**

- (1) Remove the fuse for the circuit being checked or, disconnect the battery.
- (2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 6)
- (3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

948W-195

**Fig. 6 Testing for Continuity**

1 - FUSE REMOVED FROM CIRCUIT

**STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND**

- (1) Remove the fuse and disconnect all items involved with the fuse.
- (2) Connect a test light or a voltmeter across the terminals of the fuse.
- (3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.
- (4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

**STANDARD PROCEDURE - TESTING FOR SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS**

- (1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
- (2) Replace the blown fuse.
- (3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
- (4) Start connecting the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

**STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP**

- (1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 7).
- (2) Connect the other lead of the voltmeter to the other side of the switch or component.
- (3) Operate the item.
- (4) The voltmeter will show the difference in voltage between the two points.

948W-196

**Fig. 7 Testing for Voltage Drop**

## SPECIAL TOOLS

## SPECIAL TOOLS - WIRING/TERMINAL

**PROBING TOOL PACKAGE 6807****TERMINAL PICK 6680****TERMINAL REMOVING TOOL 6932****TERMINAL REMOVING TOOL 6934**

## CONNECTOR - AUGAT

## REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector from its mating half/component.
- (3) Push down on the yellow connector locking tab to release the terminals (Fig. 8).

958W-54

**Fig. 8 AUGAT CONNECTOR REPAIR**

- 1 - LOCKING TAB  
2 - CONNECTOR

- (4) Using special tool 6932, push the terminal to remove it from the connector (Fig. 9).

803f5845

**Fig. 9 USING**

- 1 - SPECIAL TOOL 6932  
2 - CONNECTOR

- (5) Repair or replace the terminal as necessary.

## CONNECTOR - AUGAT (Continued)

## INSTALLATION

- (1) Reset the terminal locking tang.
- (2) Insert the removed wire in the same cavity on the repair connector.
- (3) Repeat steps for each wire in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
- (4) When the connector is re-assembled, the locking tab must be placed in the locked position to prevent terminal push out.
- (5) Connect connector to its mating half/component.
- (6) Connect battery and test all affected systems.

## CONNECTOR - MOLEX

## REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector from its mating half/component.
- (3) Insert special tool 6742 into the terminal end of the connector (Fig. 10).

948W-234

**Fig. 10 MOLEX CONNECTOR REPAIR**

- 1 - CONNECTOR
- 2 - SPECIAL TOOL 6742

- (4) Using special tool 6742, release the locking fingers on the terminal (Fig. 11).
- (5) Pull on the wire to remove it from the connector.
- (6) Repair or replace the terminal as necessary.

## INSTALLATION

- (1) Reset the terminal locking tang.
- (2) Insert the removed wire in the same cavity on the repair connector.
- (3) Repeat steps for each wire in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

948W-235

**Fig. 11 USING SPECIAL TOOL 6742**

- 1 - CONNECTOR
- 2 - SPECIAL TOOL 6742

- (4) Connect connector to its mating half/component.
- (5) Connect battery and test all affected systems.

## CONNECTOR - THOMAS AND BETTS

## REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector from its mating half/component.
- (3) Push in the two lock tabs on the side of the connector (Fig. 12).

803f588a

**Fig. 12 THOMAS AND BETTS CONNECTOR LOCK RELEASE TABS**

- 1 - LOCK TABS

## CONNECTOR - THOMAS AND BETTS (Continued)

(4) Insert the probe end of special tool 6934 into the back of the connector cavity (Fig. 13).

**Fig. 13 REMOVING WIRE TERMINAL**

1 - SPECIAL TOOL 6934

(5) Grasp the wire and tool 6934, then slowly remove the wire and terminal from the connector.

(6) Repair or replace the terminal as necessary.

## INSTALLATION

(1) Reset the terminal locking tang.

(2) Insert the removed wire in the same cavity on the repair connector.

(3) Repeat steps for each wire in the connector, being sure that all wires are fully seated into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

(4) Push in the single lock tab on the side of the connector (Fig. 14).

(5) Connect connector to its mating half/component.

(6) Connect battery and test all affected systems.

## DIODE

### REMOVAL

(1) Disconnect the battery.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 15).

**Fig. 14 SINGLE LOCK TAB**

1 - SINGLE LOCK TAB

948W-197

**Fig. 15 DIODE IDENTIFICATION**

1 - CURRENT FLOW

2 - BAND AROUND DIODE INDICATES CURRENT FLOW

3 - DIODE AS SHOWN IN THE DIAGRAMS

### INSTALLATION

(1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 15).

(3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.

(5) Re-connect the battery and test affected systems.

## TERMINAL

### REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector being repaired from its mating half/component.
- (3) Remove the connector locking wedge, if required (Fig. 16).

**Fig. 16 CONNECTOR LOCKING WEDGE TAB (TYPICAL)**

- 1 - CONNECTOR  
2 - CONNECTOR LOCKING WEDGE TAB

(4) Position the connector locking finger away from the terminal using the proper pick from special tool kit 6680. Pull on the wire to remove the terminal from the connector (Fig. 17) (Fig. 18).

**Fig. 17 TERMINAL REMOVAL**

- 1 - CONNECTOR  
2 - FROM SPECIAL TOOL KIT 6680

**Fig. 18 TERMINAL REMOVAL USING SPECIAL TOOL**

- 1 - FROM SPECIAL TOOL KIT 6680  
2 - CONNECTOR

(5) Cut the wire 6 inches from the back of the connector.

### INSTALLATION

- (1) Select a wire from the terminal repair assembly that best matches the color wire being repaired.
- (2) Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
- (3) Splice the repair wire to the wire harness .
- (4) Insert the repaired wire into the connector.
- (5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
- (6) Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
- (7) Connect battery and test all affected systems.

## WIRE

### STANDARD PROCEDURE

#### STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 19).

**Fig. 19 SPLICE CLIP**

(4) Using crimping tool, Miller p/n 8272, crimp the splice clip and wires together (Fig. 20)

**Fig. 20 CRIMPING TOOL**

(5) Solder the connection together using rosin core type solder only (Fig. 21).

**CAUTION: DO NOT USE ACID CORE SOLDER.**

**Fig. 21 SOLDER**

(6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 22).

**Fig. 22 HEAT SHRINK TUBING**

## 8W-31 TRANSMISSION CONTROL SYSTEM

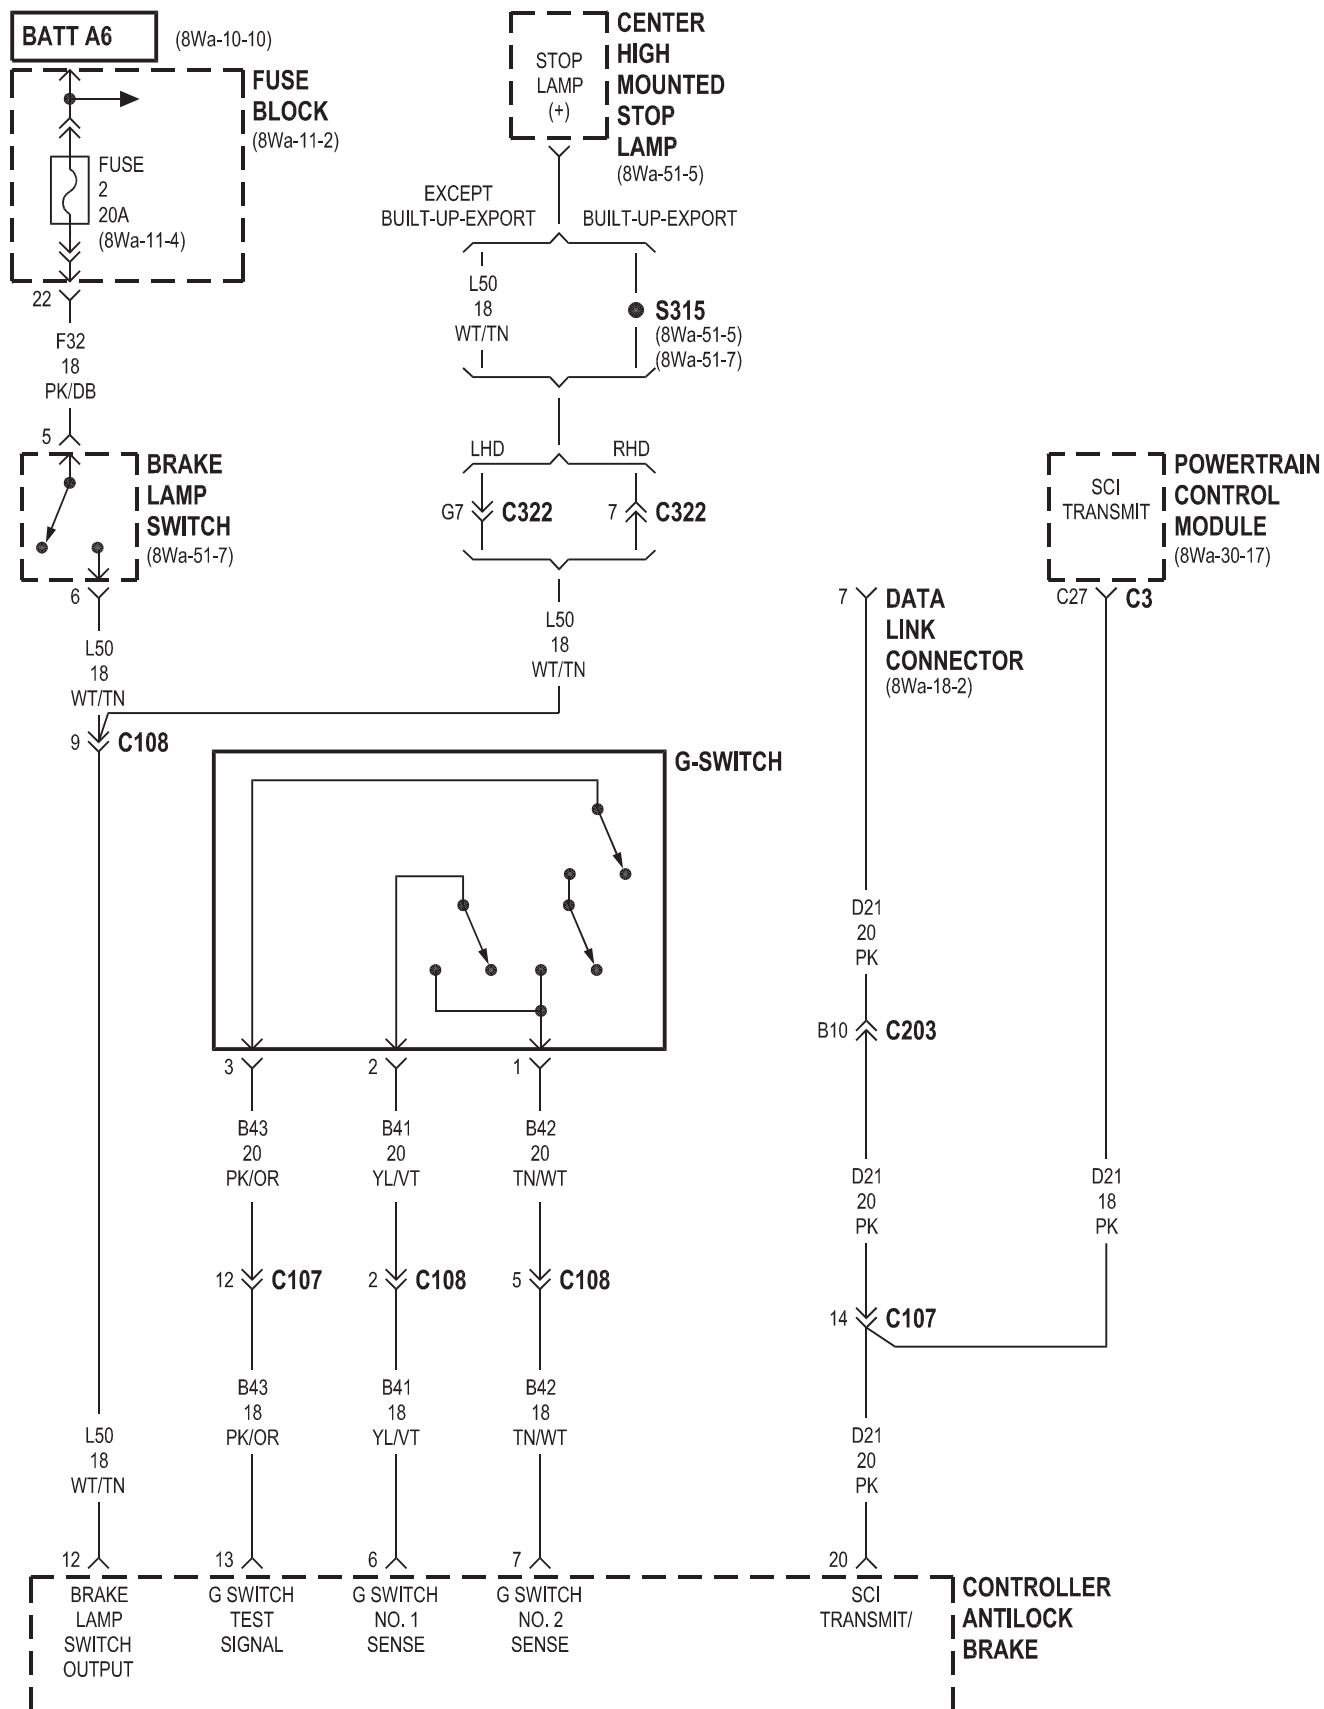

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Brake Lamp Switch . . . . .	8Wa-31-2	G105 . . . . .	8Wa-31-2
Brake Transmission Shift Interlock Solenoid . . . . .	8Wa-31-2	G300 . . . . .	8Wa-31-2
Fuse 10 (FB) . . . . .	8Wa-31-2	Instrument Cluster . . . . .	8Wa-31-2
Fuse 11 (FB) . . . . .	8Wa-31-2	Powertrain Control Module . . . . .	8Wa-31-2
Fuse Block . . . . .	8Wa-31-2	Torque Converter Clutch Solenoid . . . . .	8Wa-31-2
		Transfer Case Switch . . . . .	8Wa-31-2

## 8W-35 ANTILOCK BRAKES

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Antilock Brake Relay . . . . .	8Wa-35-2	Fuse Block . . . . .	8Wa-35-2, 3
Brake Lamp Switch . . . . .	8Wa-35-3	G-Switch . . . . .	8Wa-35-3
Brake Transmission Shift Interlock Solenoid . . . . .	8Wa-35-2	G100 . . . . .	8Wa-35-2
Center High Mounted Stop Lamp . . . . .	8Wa-35-3	G101 . . . . .	8Wa-35-2
Controller Antilock Brake . . . . .	8Wa-35-2, 3, 4	Instrument Cluster . . . . .	8Wa-35-2
Data Link Connector . . . . .	8Wa-35-3	Left Front Wheel Speed Sensor . . . . .	8Wa-35-4
Fuse 2 (FB) . . . . .	8Wa-35-3	Left Rear Wheel Speed Sensor . . . . .	8Wa-35-4
Fuse 7 (FB) . . . . .	8Wa-35-2	Power Distribution Center . . . . .	8Wa-35-2
Fuse 10 (FB) . . . . .	8Wa-35-2	Powertrain Control Module . . . . .	8Wa-35-3
Fuse 8 (PDC) . . . . .	8Wa-35-2	Right Front Wheel Speed Sensor . . . . .	8Wa-35-4
Fuse 12 (PDC) . . . . .	8Wa-35-2	Right Rear Wheel Speed Sensor . . . . .	8Wa-35-4

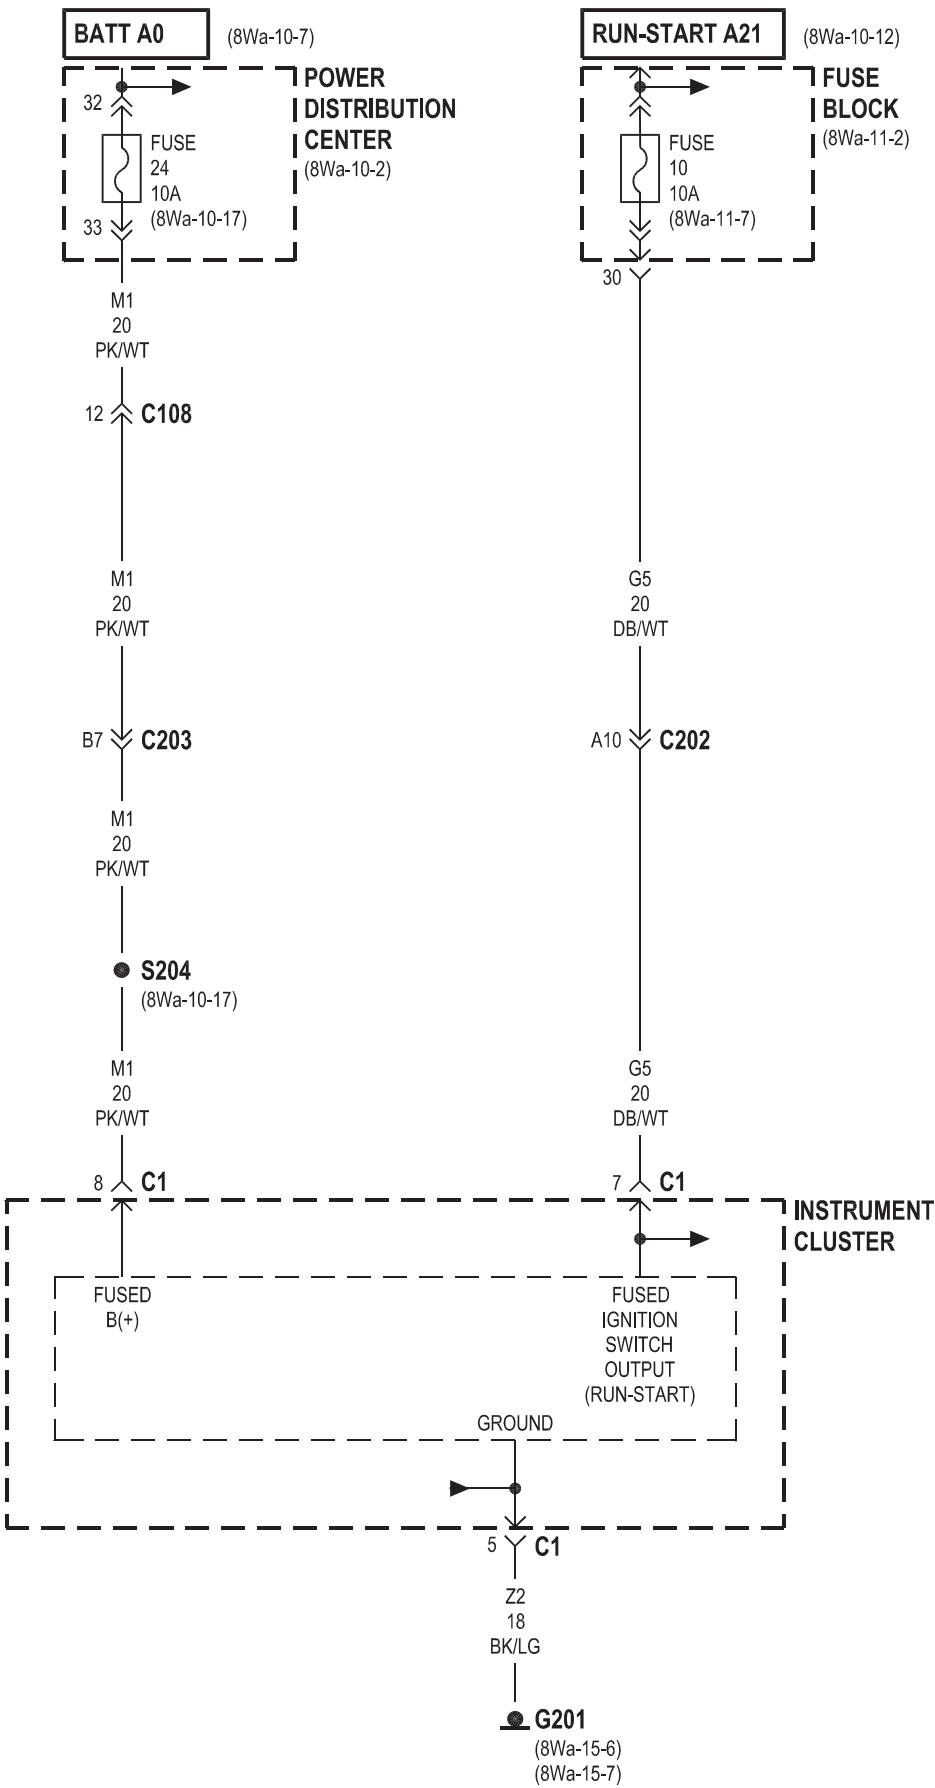

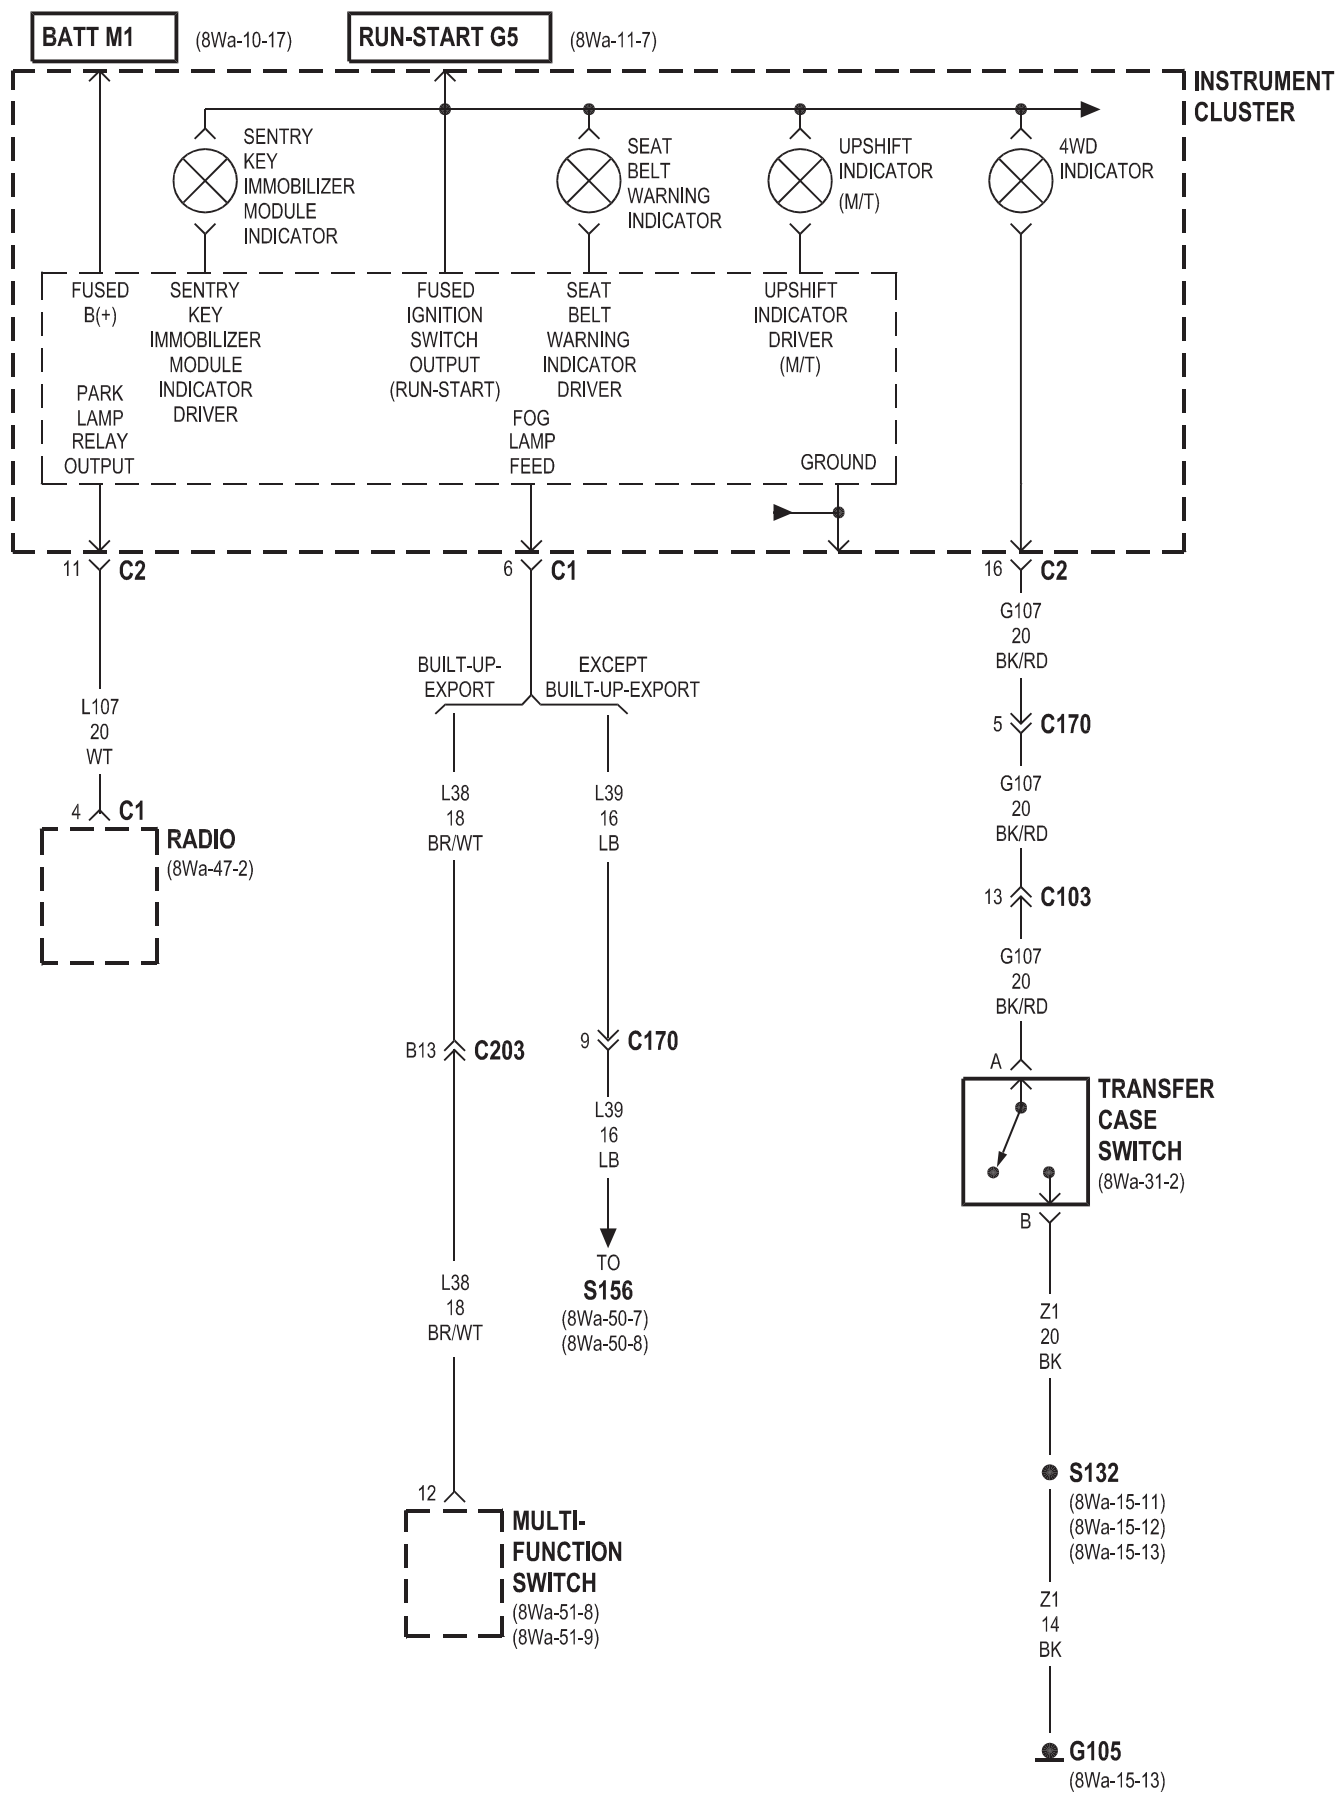

## 8W-40 INSTRUMENT CLUSTER

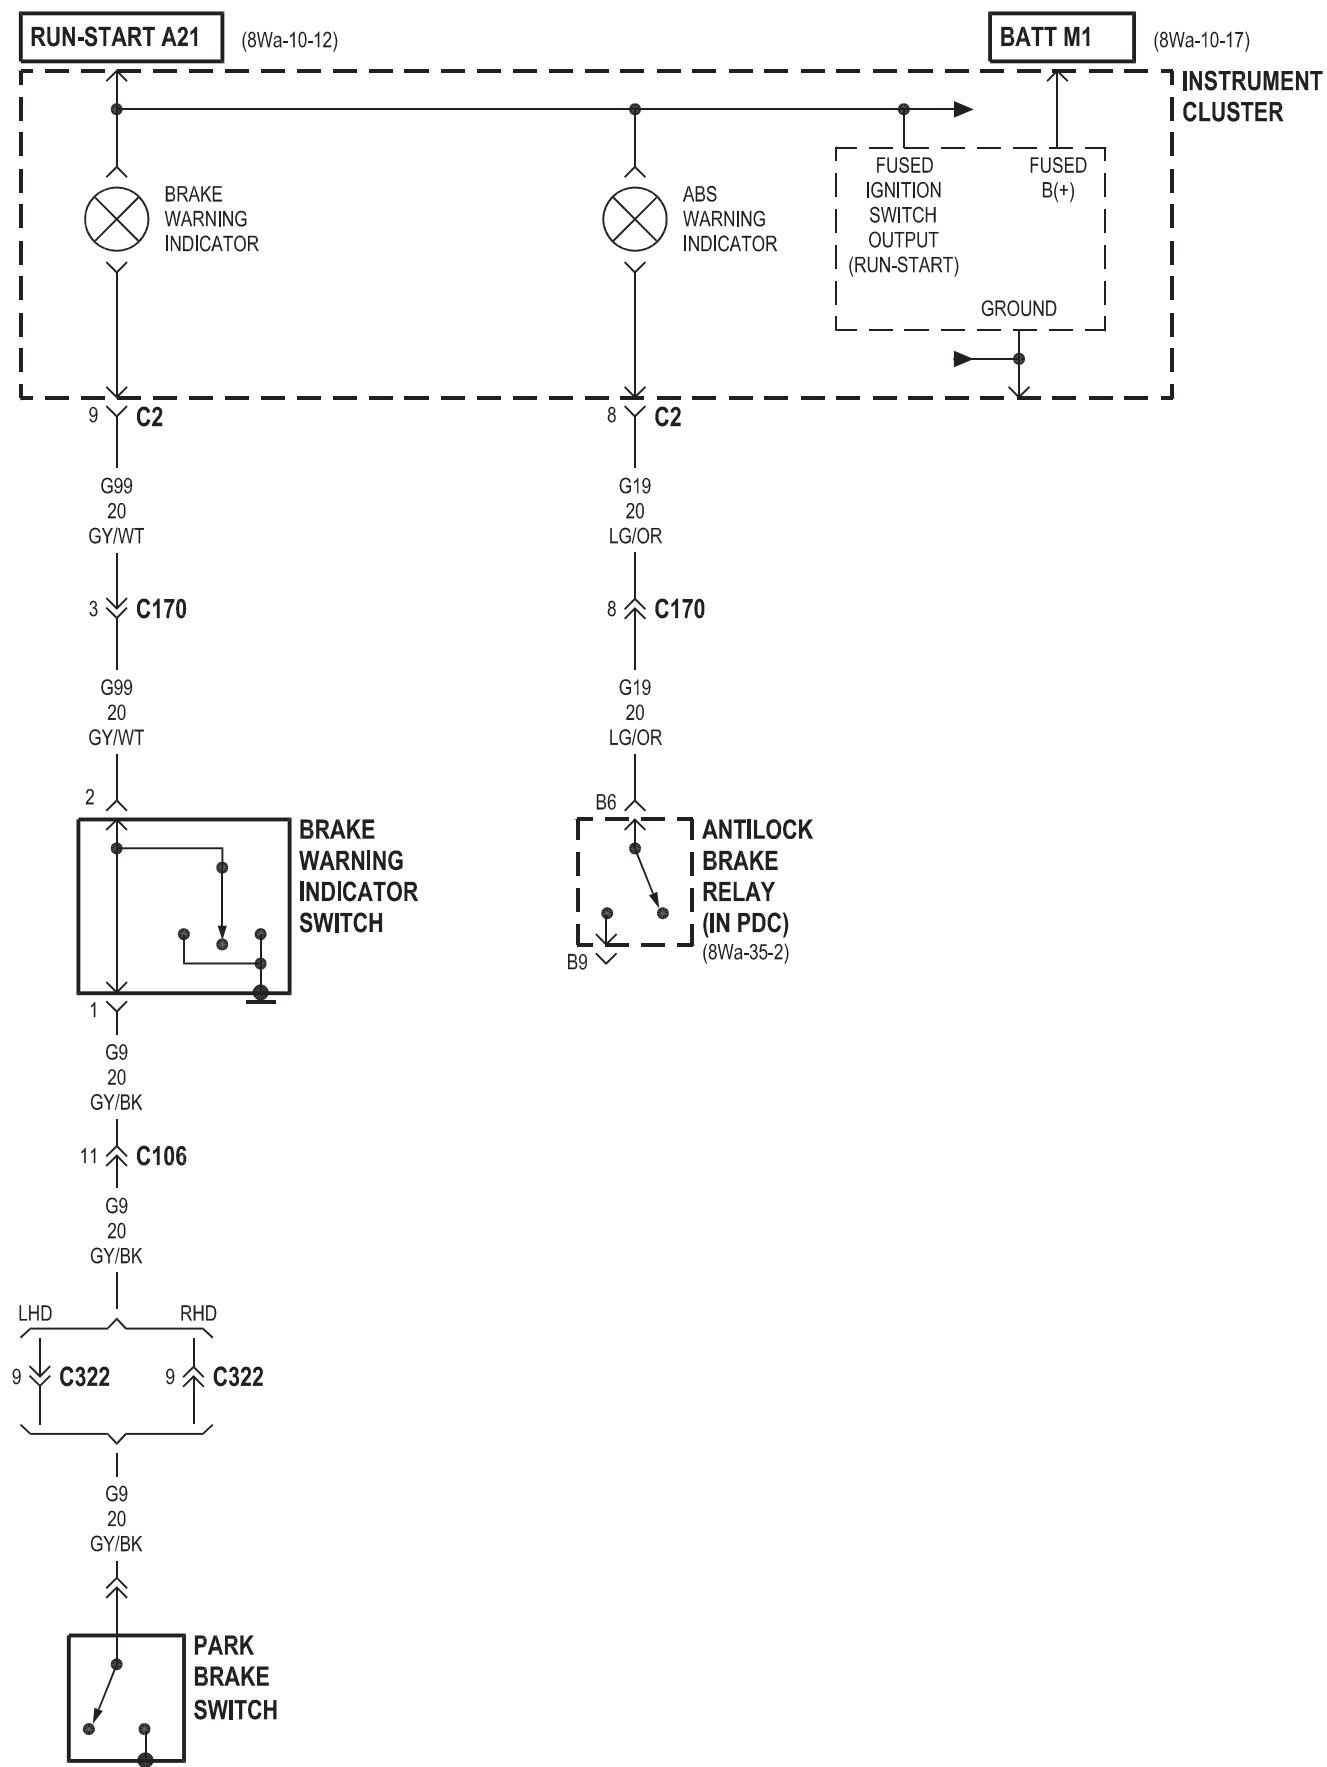

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Airbag Control Module . . . . .	8Wa-40-4	G300 . . . . .	8Wa-40-7
Antilock Brake Relay . . . . .	8Wa-40-6	G302 . . . . .	8Wa-40-4
Brake Warning Indicator Switch . . . . .	8Wa-40-6	Ignition Switch . . . . .	8Wa-40-7
Data Link Connector . . . . .	8Wa-40-3, 4	Instrument Cluster . . . . .	8Wa-40-2, 3, 4, 5, 6, 7, 8, 9
Daytime Running Lamp Module . . . . .	8Wa-40-9	Multi-Function Switch . . . . .	8Wa-40-4, 5, 7, 9
Driver Door Ajar Switch . . . . .	8Wa-40-7	Park Brake Switch . . . . .	8Wa-40-6
Engine Coolant Temperature Sensor . . . . .	8Wa-40-3	Passenger Door Ajar Switch . . . . .	8Wa-40-7
Engine Oil Pressure Sensor . . . . .	8Wa-40-3	Power Distribution Center . . . . .	8Wa-40-2
Fog Lamp Relay . . . . .	8Wa-40-9	Powertrain Control Module . . . . .	8Wa-40-3, 4
Fuel Pump Module . . . . .	8Wa-40-3	Radio . . . . .	8Wa-40-5
Fuse 4 (FB) . . . . .	8Wa-40-7	Rear Window Defogger Relay . . . . .	8Wa-40-8
Fuse 10 (FB) . . . . .	8Wa-40-2	Rear Window Defogger Switch . . . . .	8Wa-40-8
Fuse 24 (PDC) . . . . .	8Wa-40-2	Seat Belt Switch . . . . .	8Wa-40-4
Fuse Block . . . . .	8Wa-40-2, 7	Transfer Case Switch . . . . .	8Wa-40-5
G105 . . . . .	8Wa-40-5	Vehicle Speed Sensor . . . . .	8Wa-40-3
G201 . . . . .	8Wa-40-2		

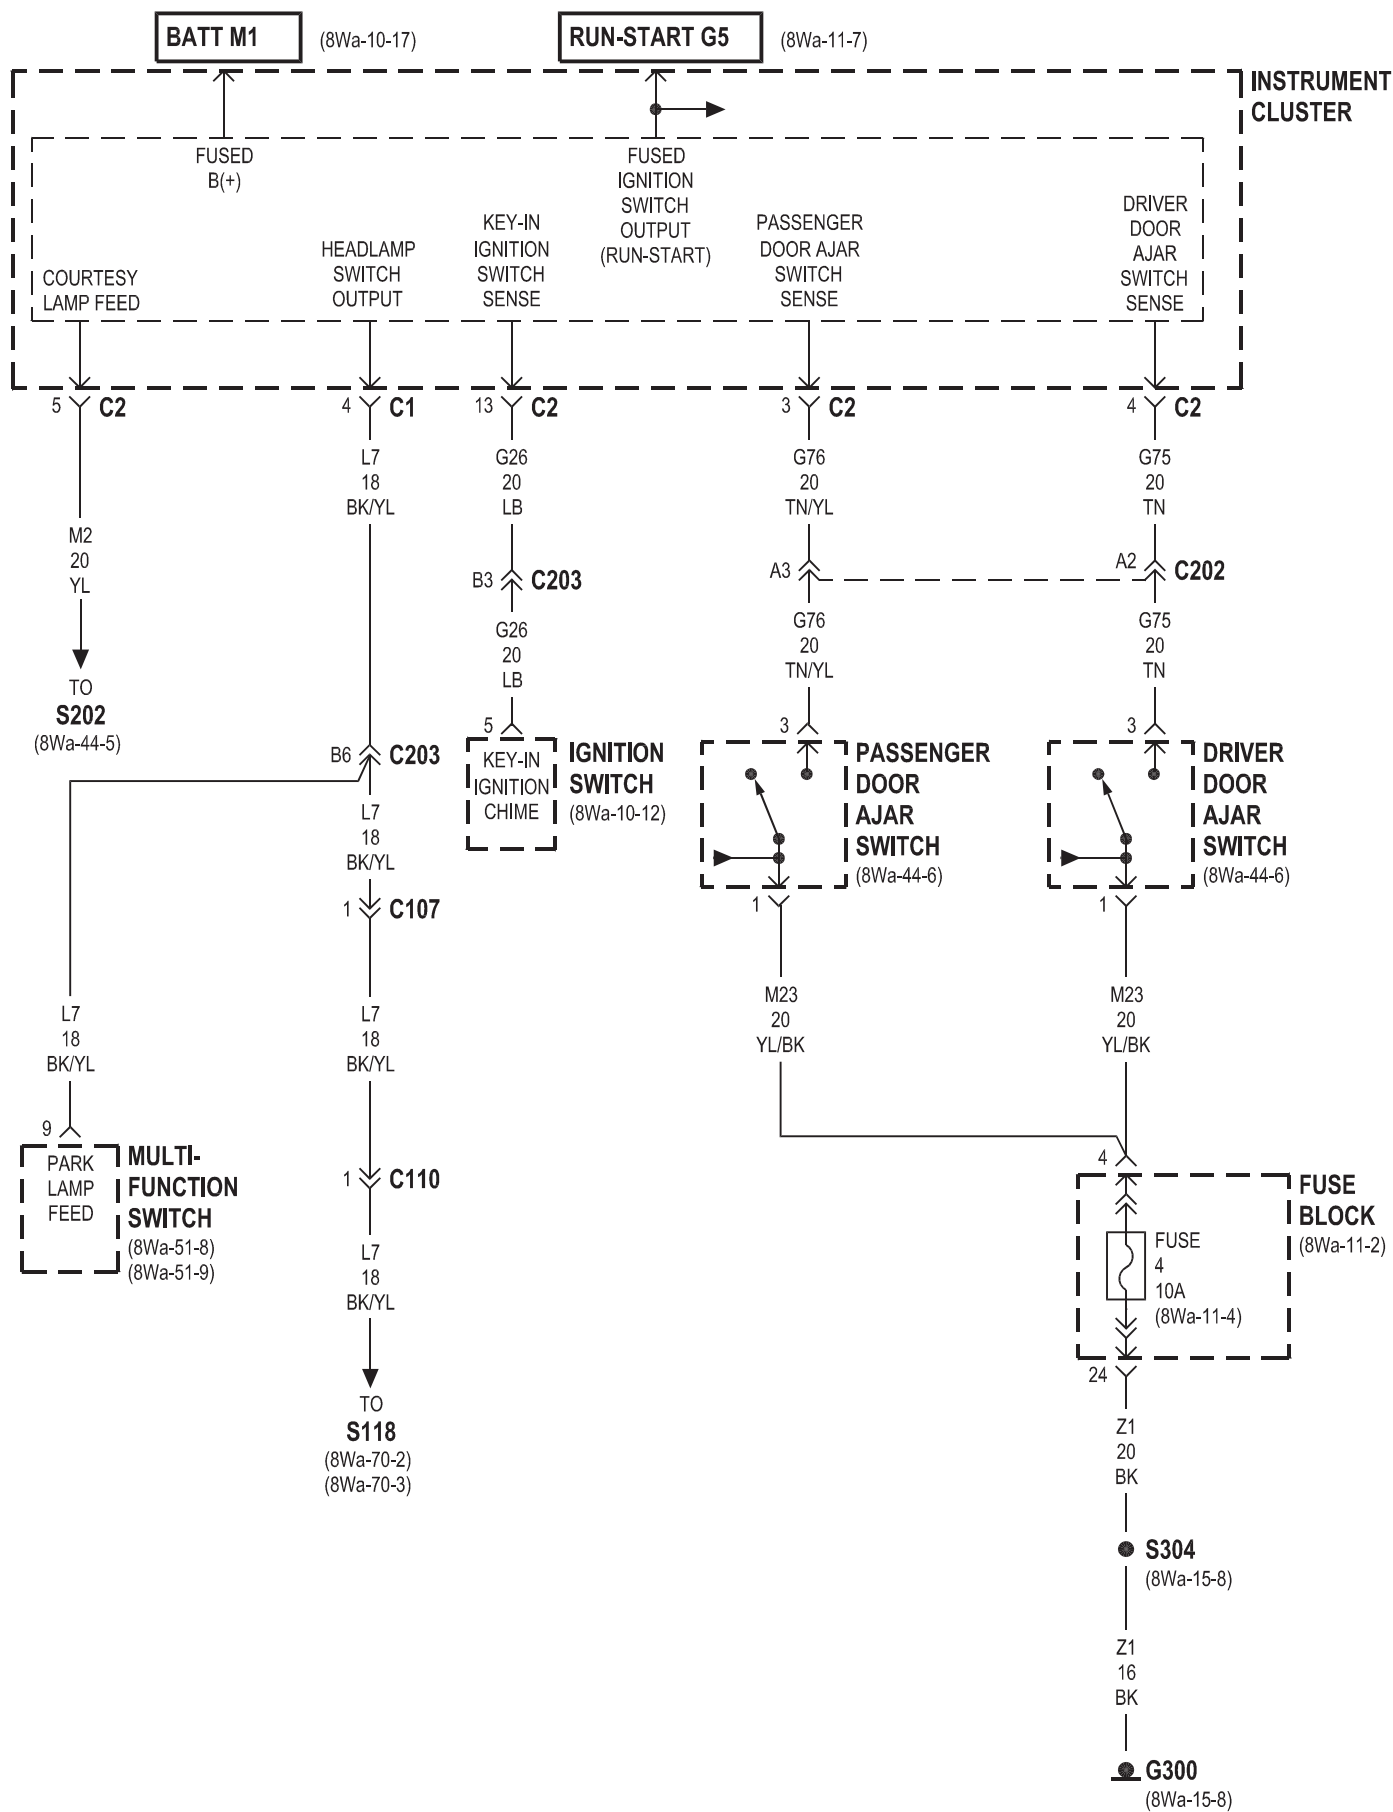

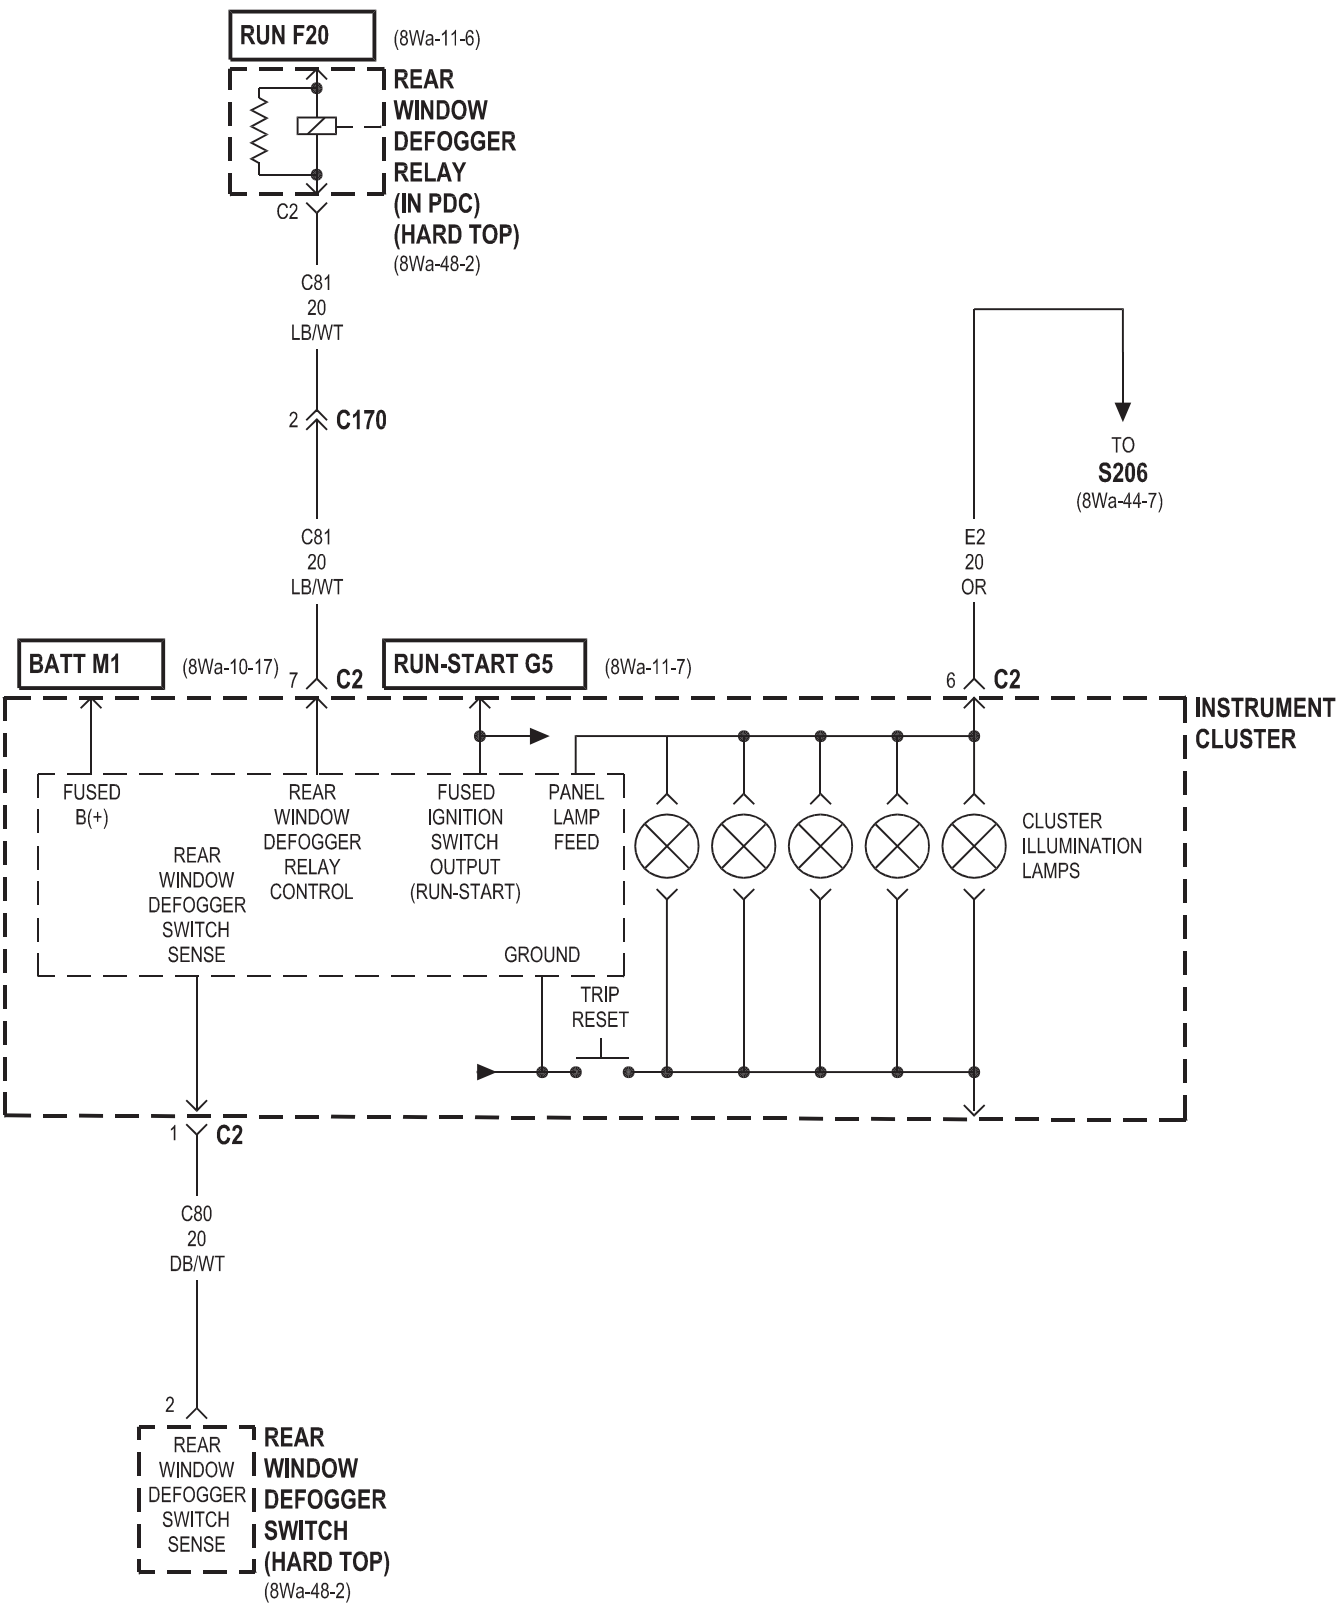

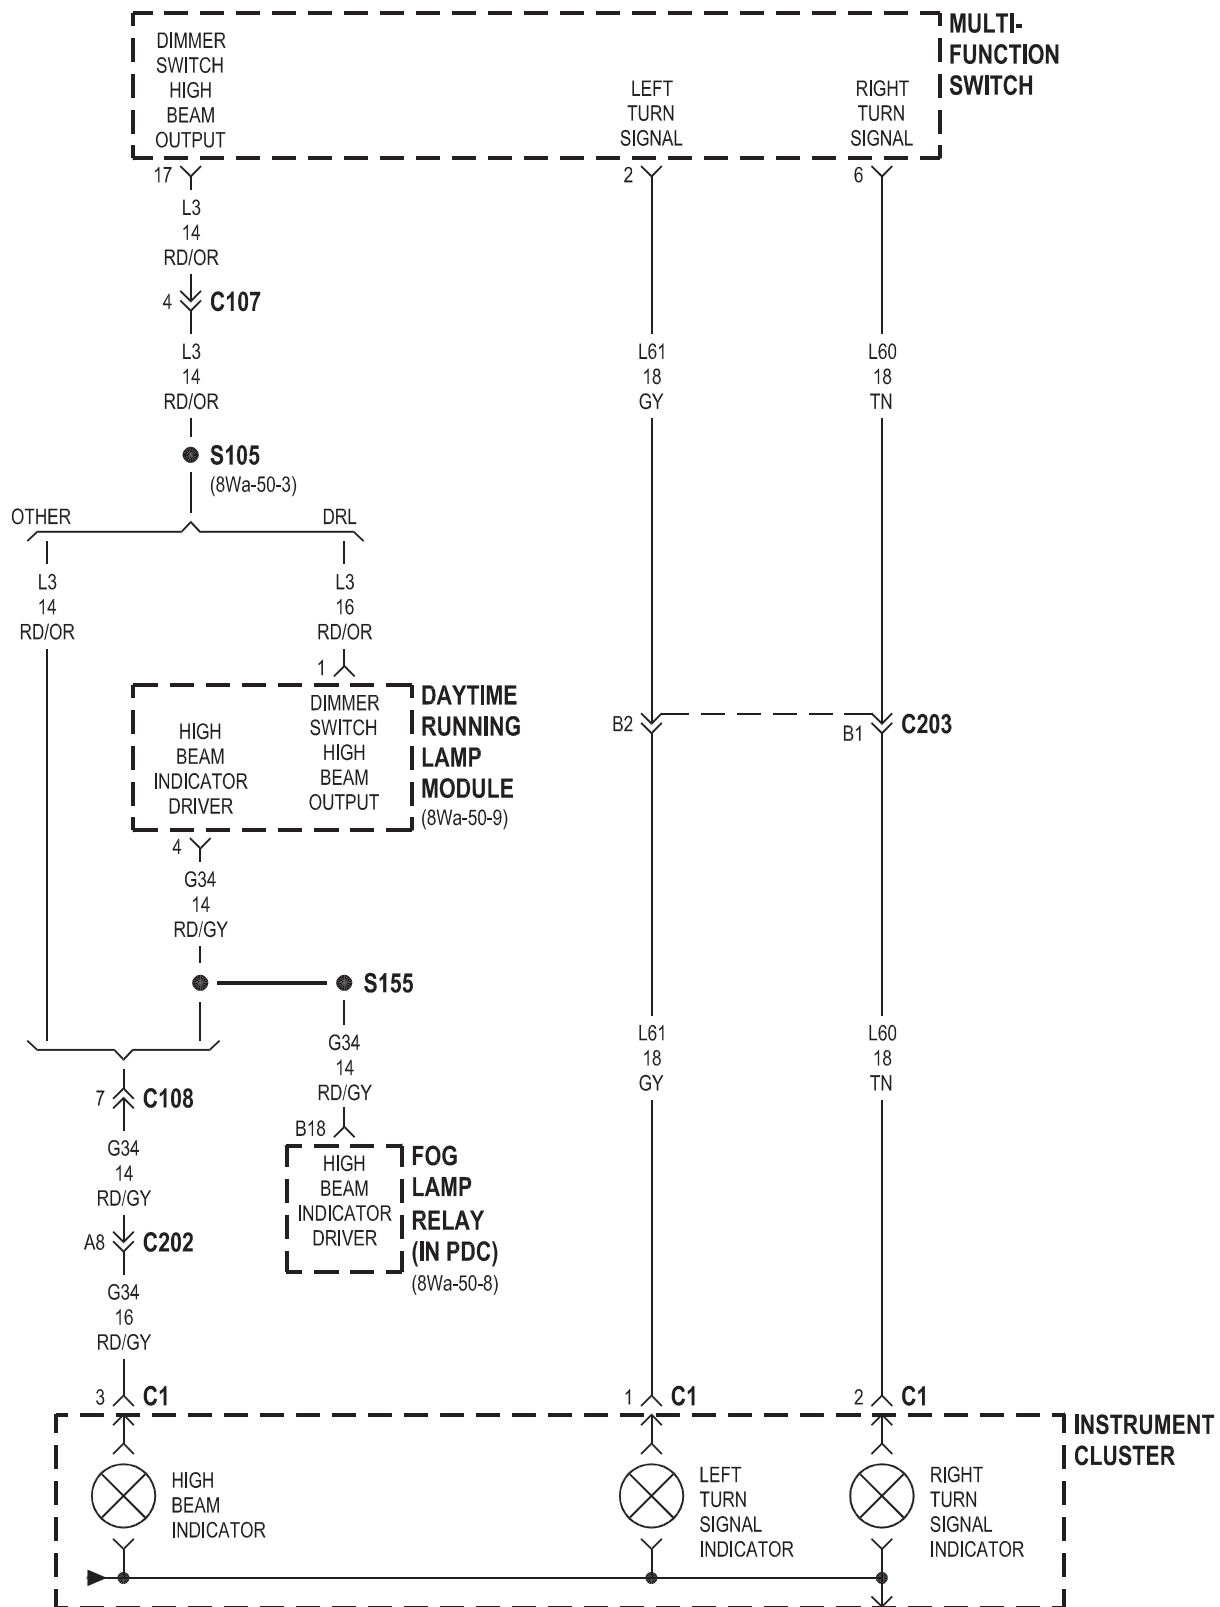

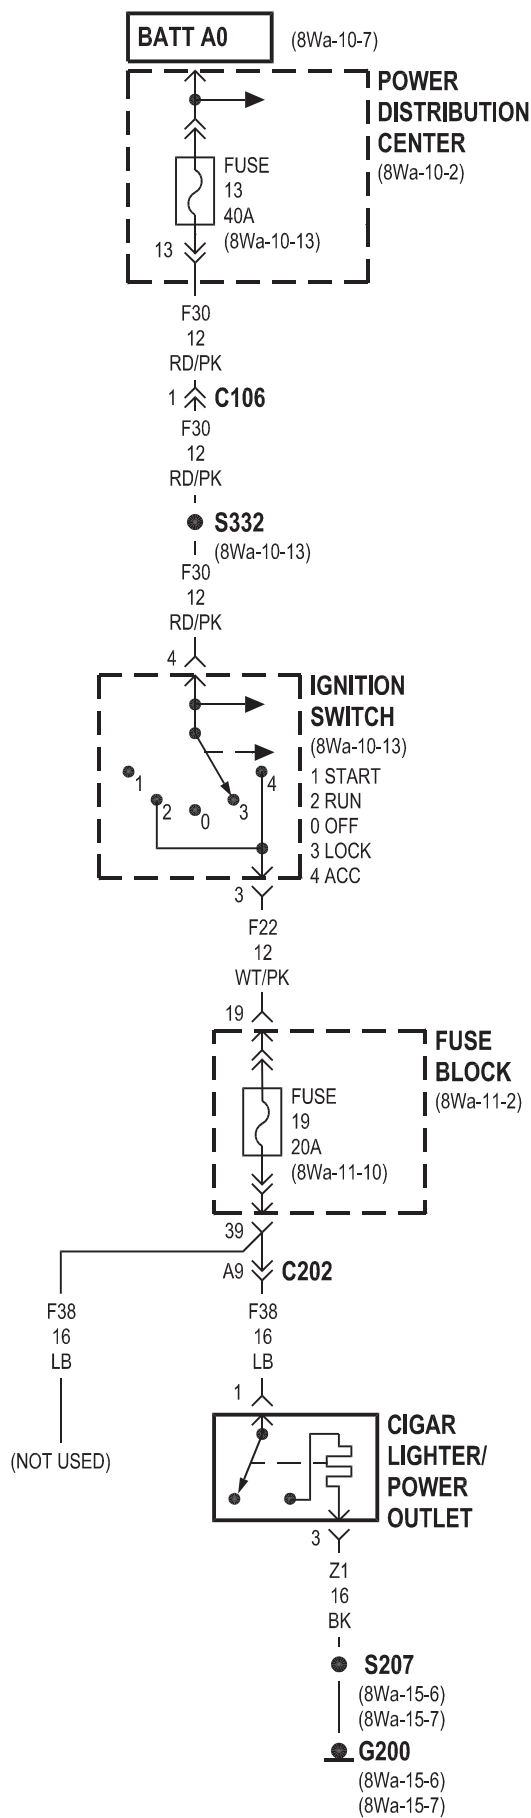

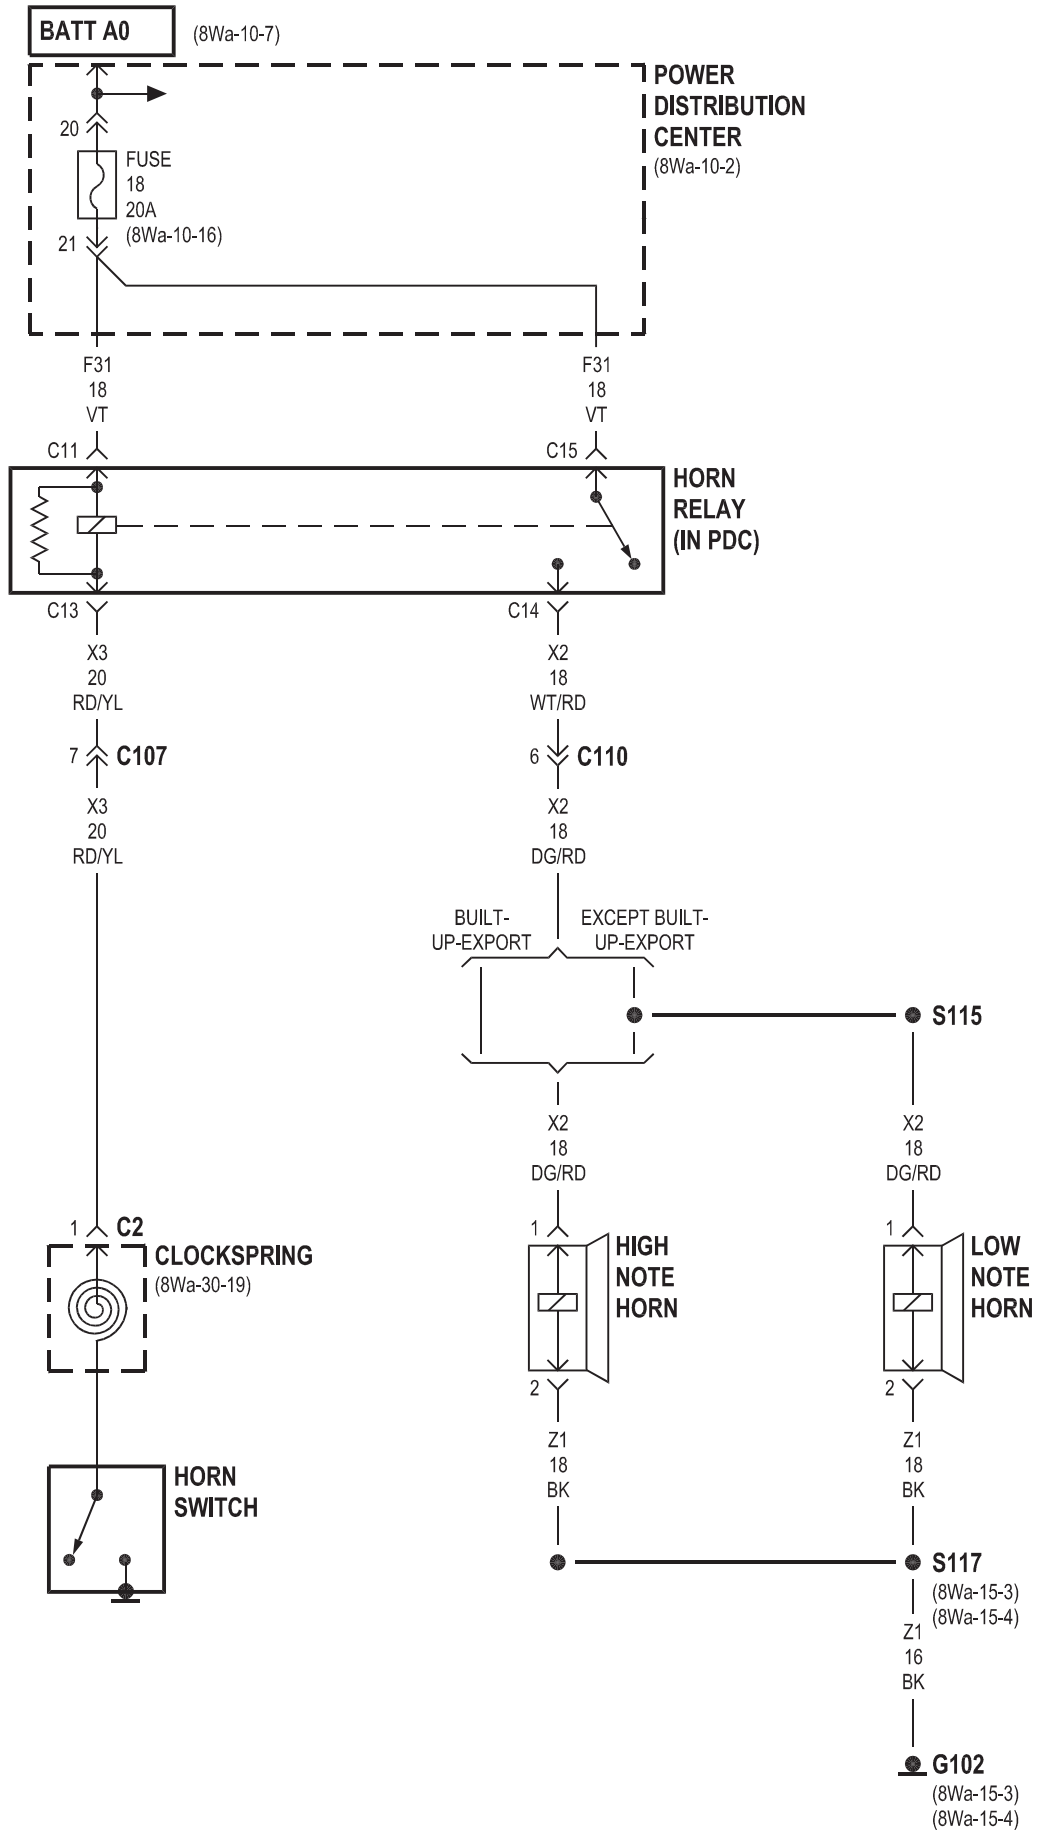

## 8W-41 HORN/CIGAR LIGHTER/POWER OUTLET

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Cigar Lighter/Power Outlet . . . . .	8Wa-41-2	G200 . . . . .	8Wa-41-2
Clockspring . . . . .	8Wa-41-3	High Note Horn . . . . .	8Wa-41-3
Fuse 19 (FB) . . . . .	8Wa-41-2	Horn Relay . . . . .	8Wa-41-3
Fuse 13 (PDC) . . . . .	8Wa-41-2	Horn Switch . . . . .	8Wa-41-3
Fuse 18 (PDC) . . . . .	8Wa-41-3	Ignition Switch . . . . .	8Wa-41-2
Fuse Block . . . . .	8Wa-41-2	Low Note Horn . . . . .	8Wa-41-3
G102 . . . . .	8Wa-41-3	Power Distribution Center . . . . .	8Wa-41-2, 3

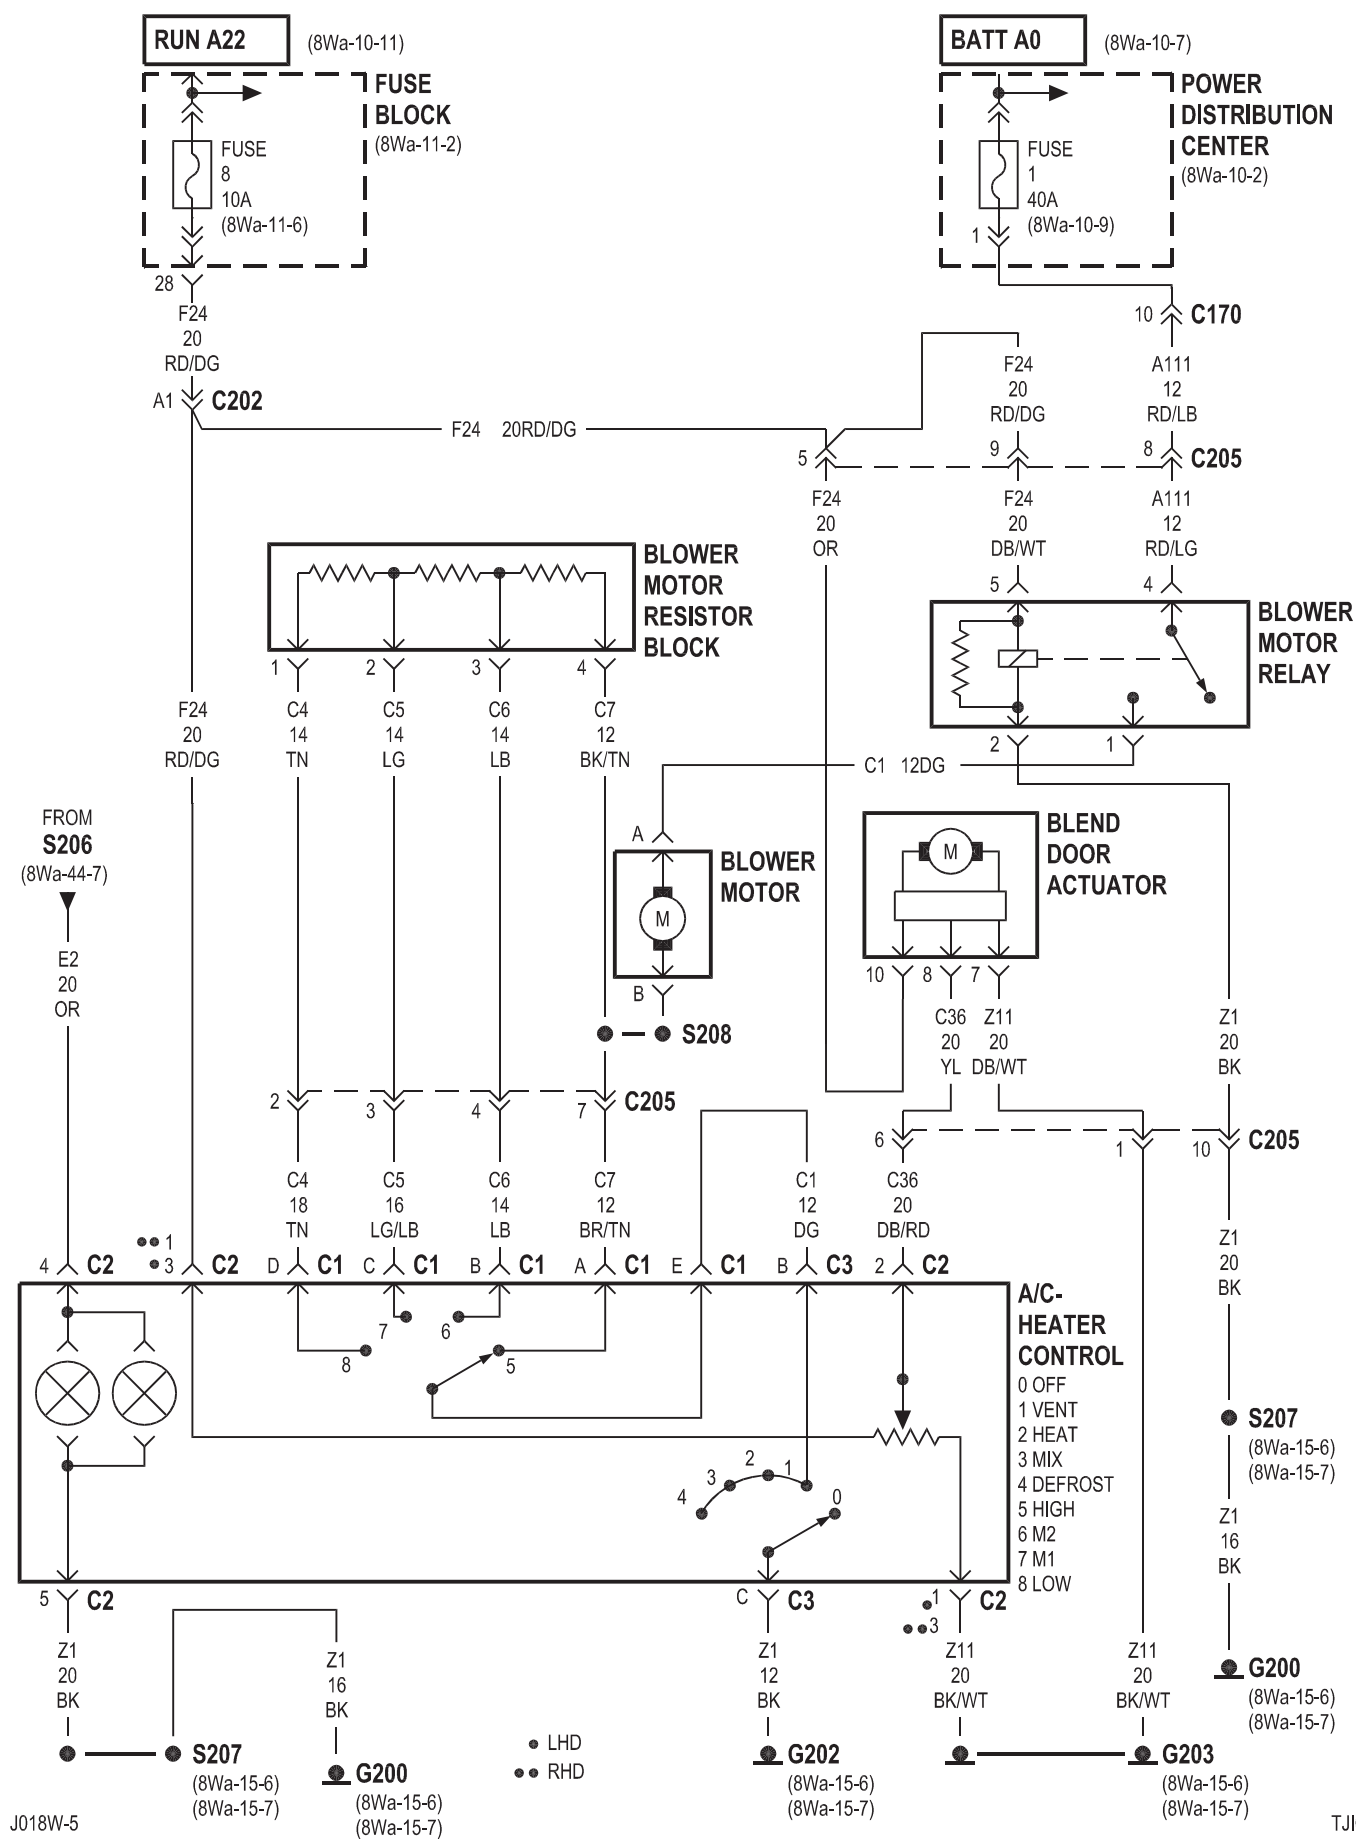

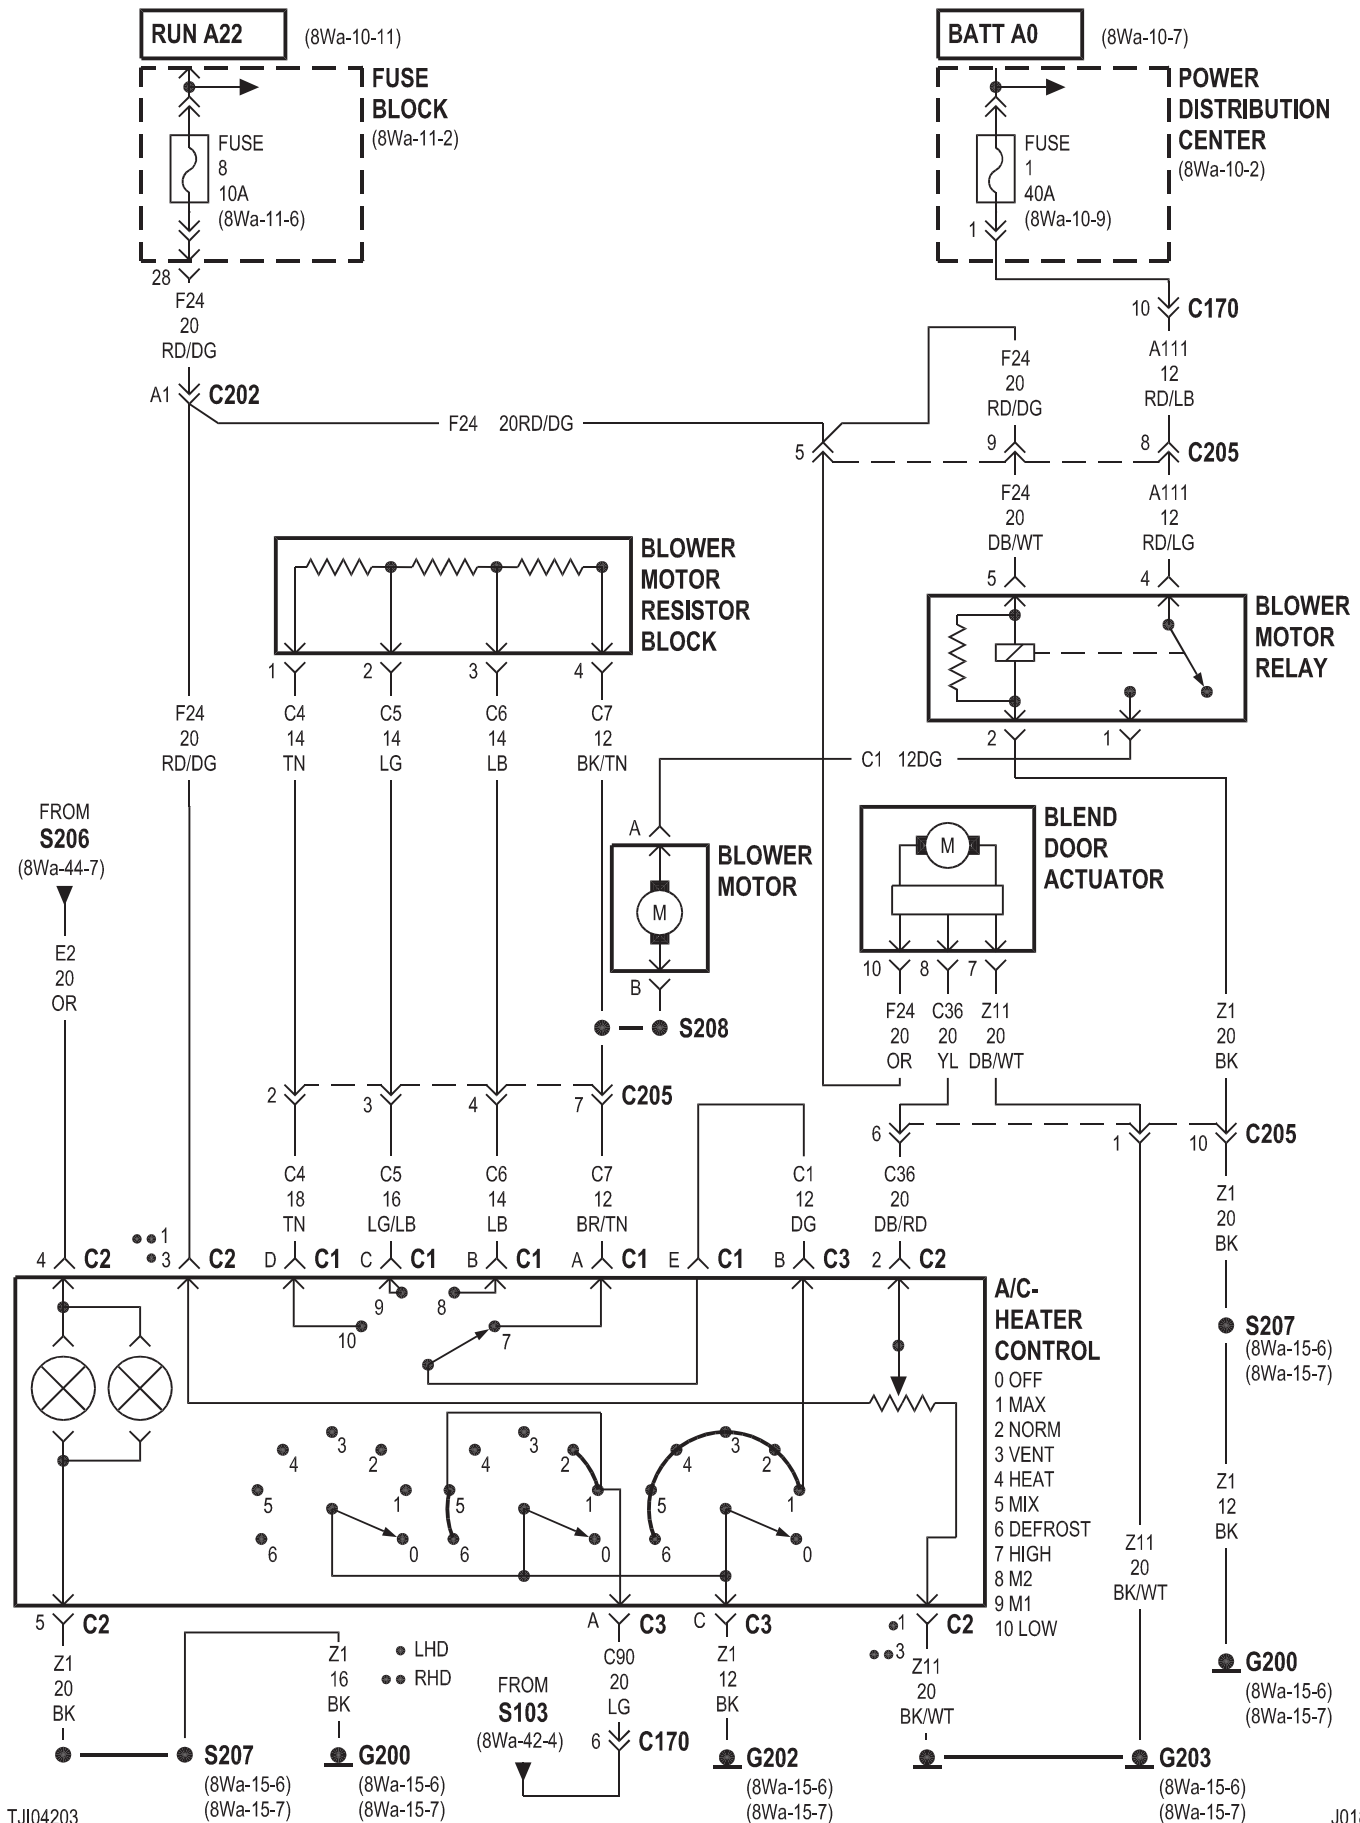

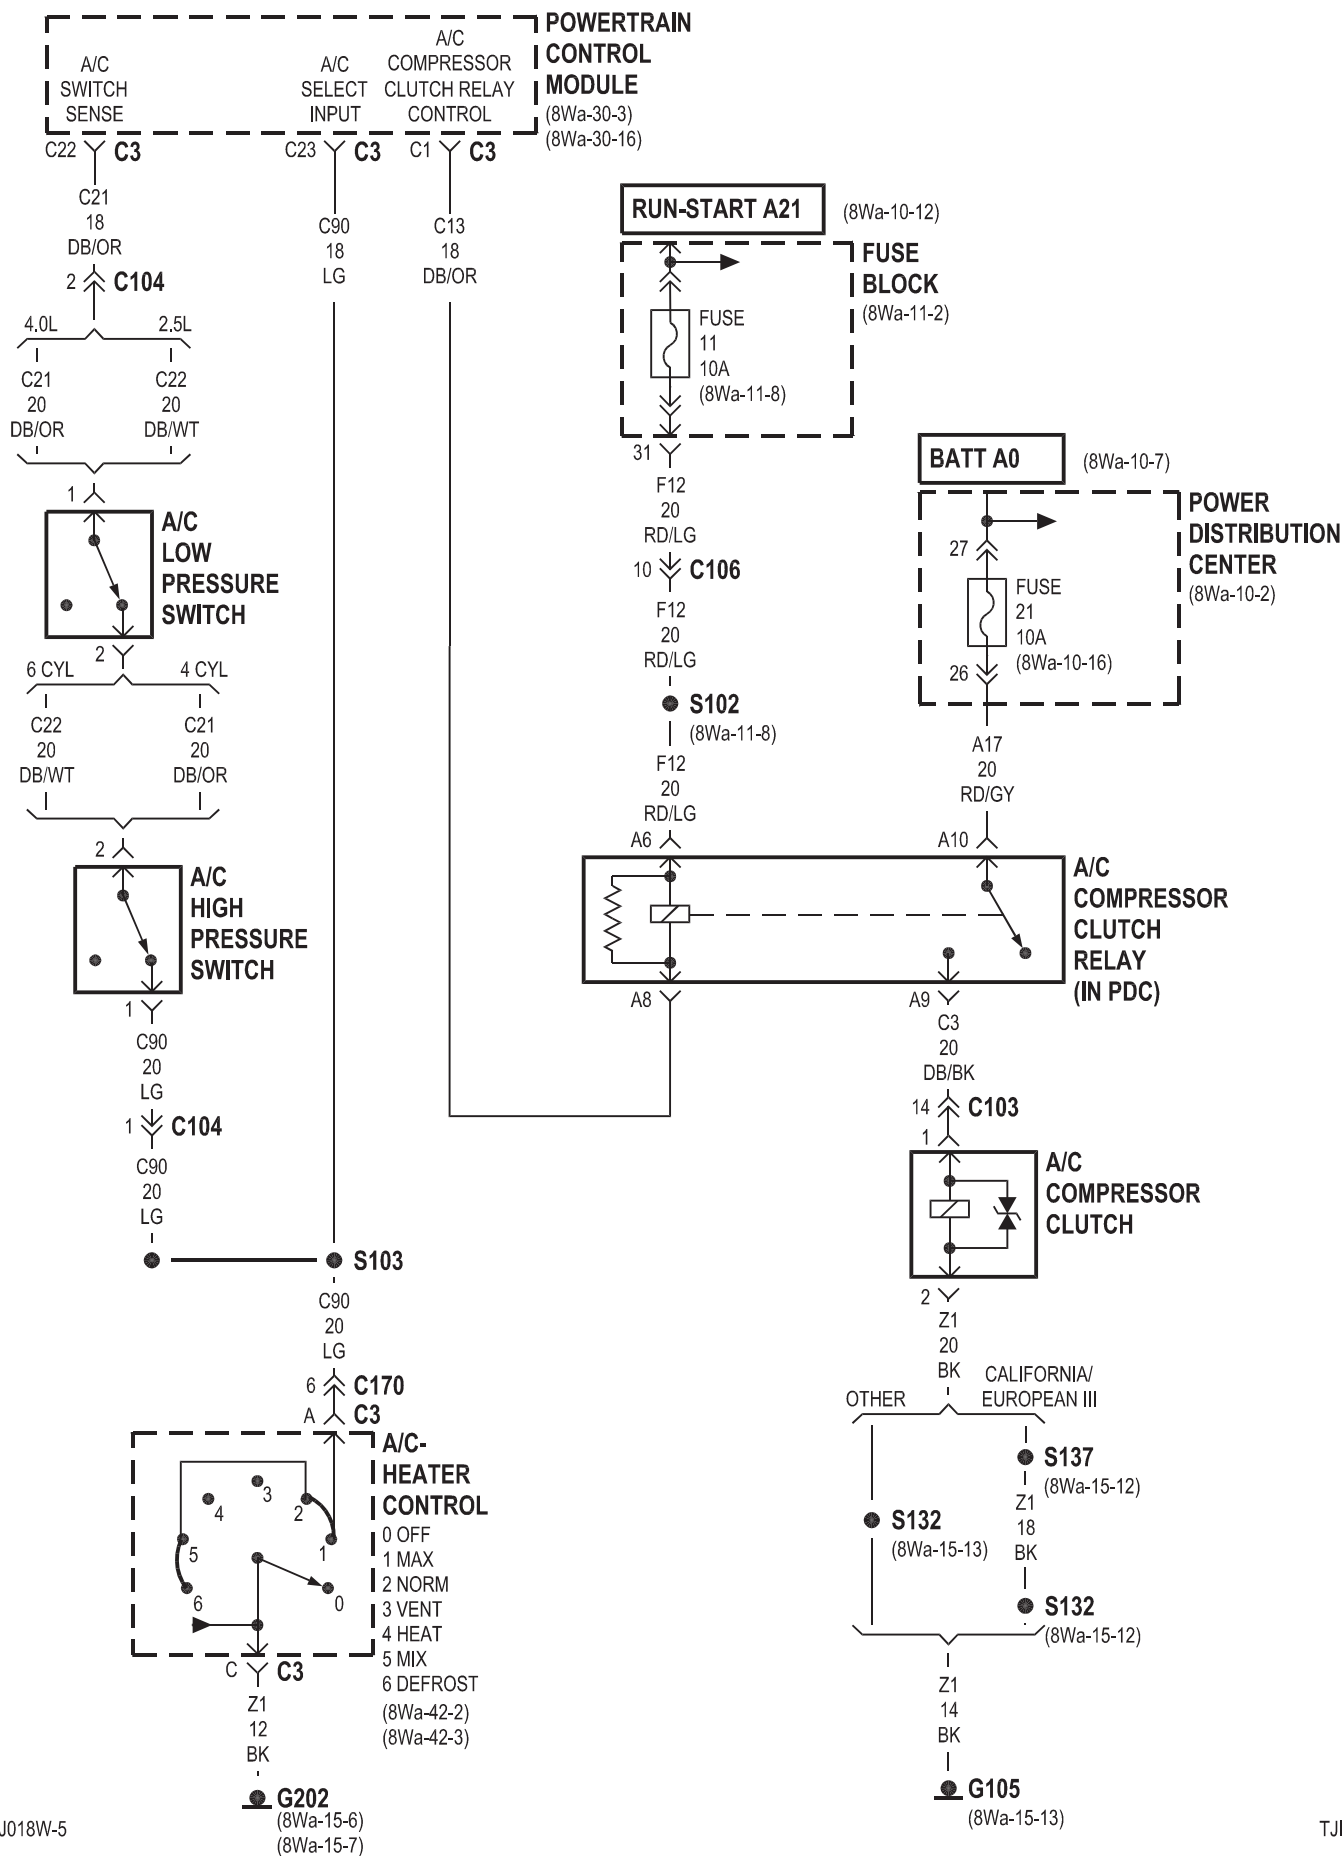

## 8W-42 AIR CONDITIONING-HEATER

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
A/C Compressor Clutch . . . . .	8Wa-42-4	Fuse 11 (FB) . . . . .	8Wa-42-4
A/C Compressor Clutch Relay . . . . .	8Wa-42-4	Fuse 1 (PDC) . . . . .	8Wa-42-2, 3
A/C High Pressure Switch . . . . .	8Wa-42-4	Fuse 21 (PDC) . . . . .	8Wa-42-4
A/C Low Pressure Switch . . . . .	8Wa-42-4	Fuse Block . . . . .	8Wa-42-2, 3, 4
A/C-Heater Control . . . . .	8Wa-42-2, 3, 4	G105 . . . . .	8Wa-42-4
Blend Door Actuator . . . . .	8Wa-42-2, 3	G200 . . . . .	8Wa-42-2, 3
Blower Motor . . . . .	8Wa-42-2, 3	G202 . . . . .	8Wa-42-2, 3, 4
Blower Motor Relay . . . . .	8Wa-42-2, 3	G203 . . . . .	8Wa-42-2, 3
Blower Motor Resistor Block . . . . .	8Wa-42-2, 3	Power Distribution Center . . . . .	8Wa-42-2, 3, 4
Fuse 8 (FB) . . . . .	8Wa-42-2, 3	Powertrain Control Module . . . . .	8Wa-42-4

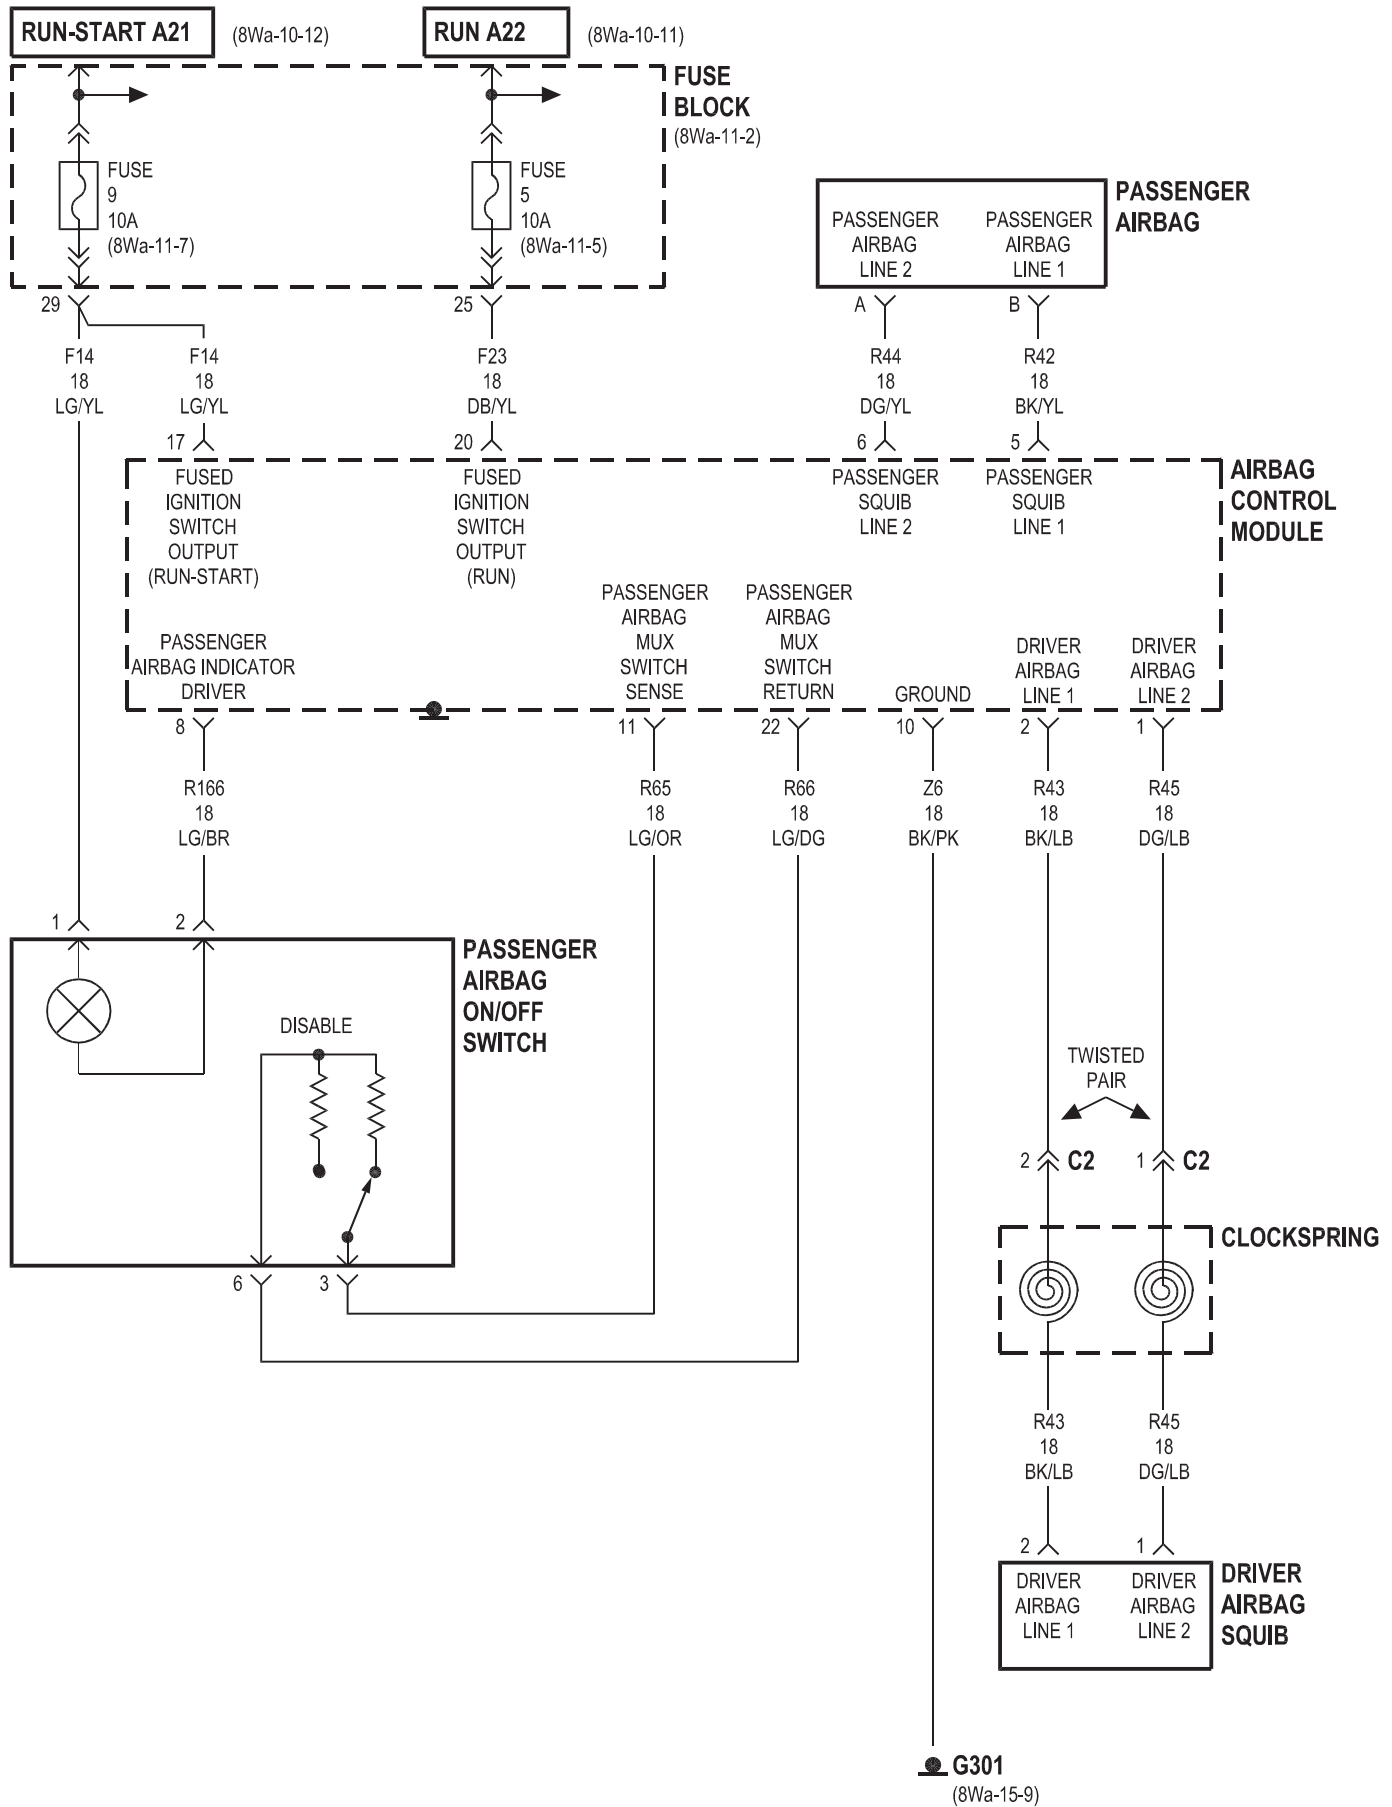

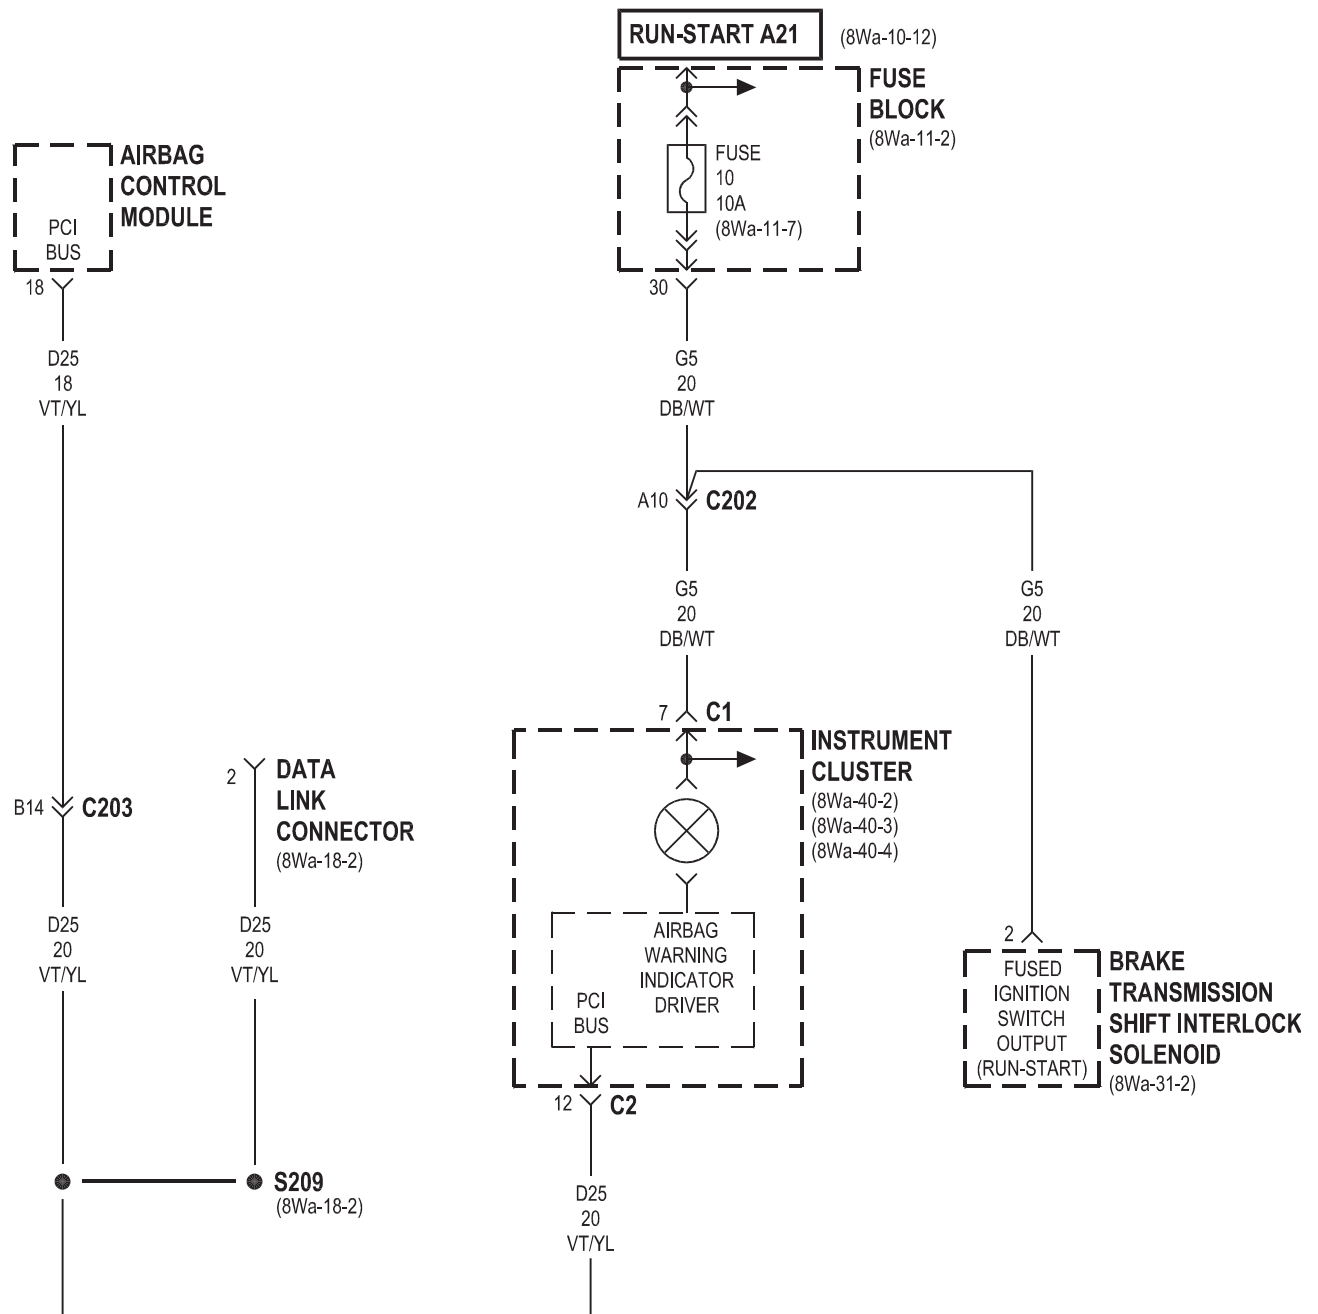

## 8W-43 AIRBAG SYSTEM

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Airbag Control Module . . . . .	8Wa-43-2, 3	Fuse 9 (FB) . . . . .	8Wa-43-2
Brake Transmission Shift Interlock Solenoid . . . . .	8Wa-43-3	Fuse 10 (FB) . . . . .	8Wa-43-3
Clockspring . . . . .	8Wa-43-2	Fuse Block . . . . .	8Wa-43-2, 3
Data Link Connector . . . . .	8Wa-43-3	G301 . . . . .	8Wa-43-2
Driver Airbag Squib . . . . .	8Wa-43-2	Instrument Cluster . . . . .	8Wa-43-3
Fuse 5 (FB) . . . . .	8Wa-43-2	Passenger Airbag . . . . .	8Wa-43-2
		Passenger Airbag On/Off Switch . . . . .	8Wa-43-2

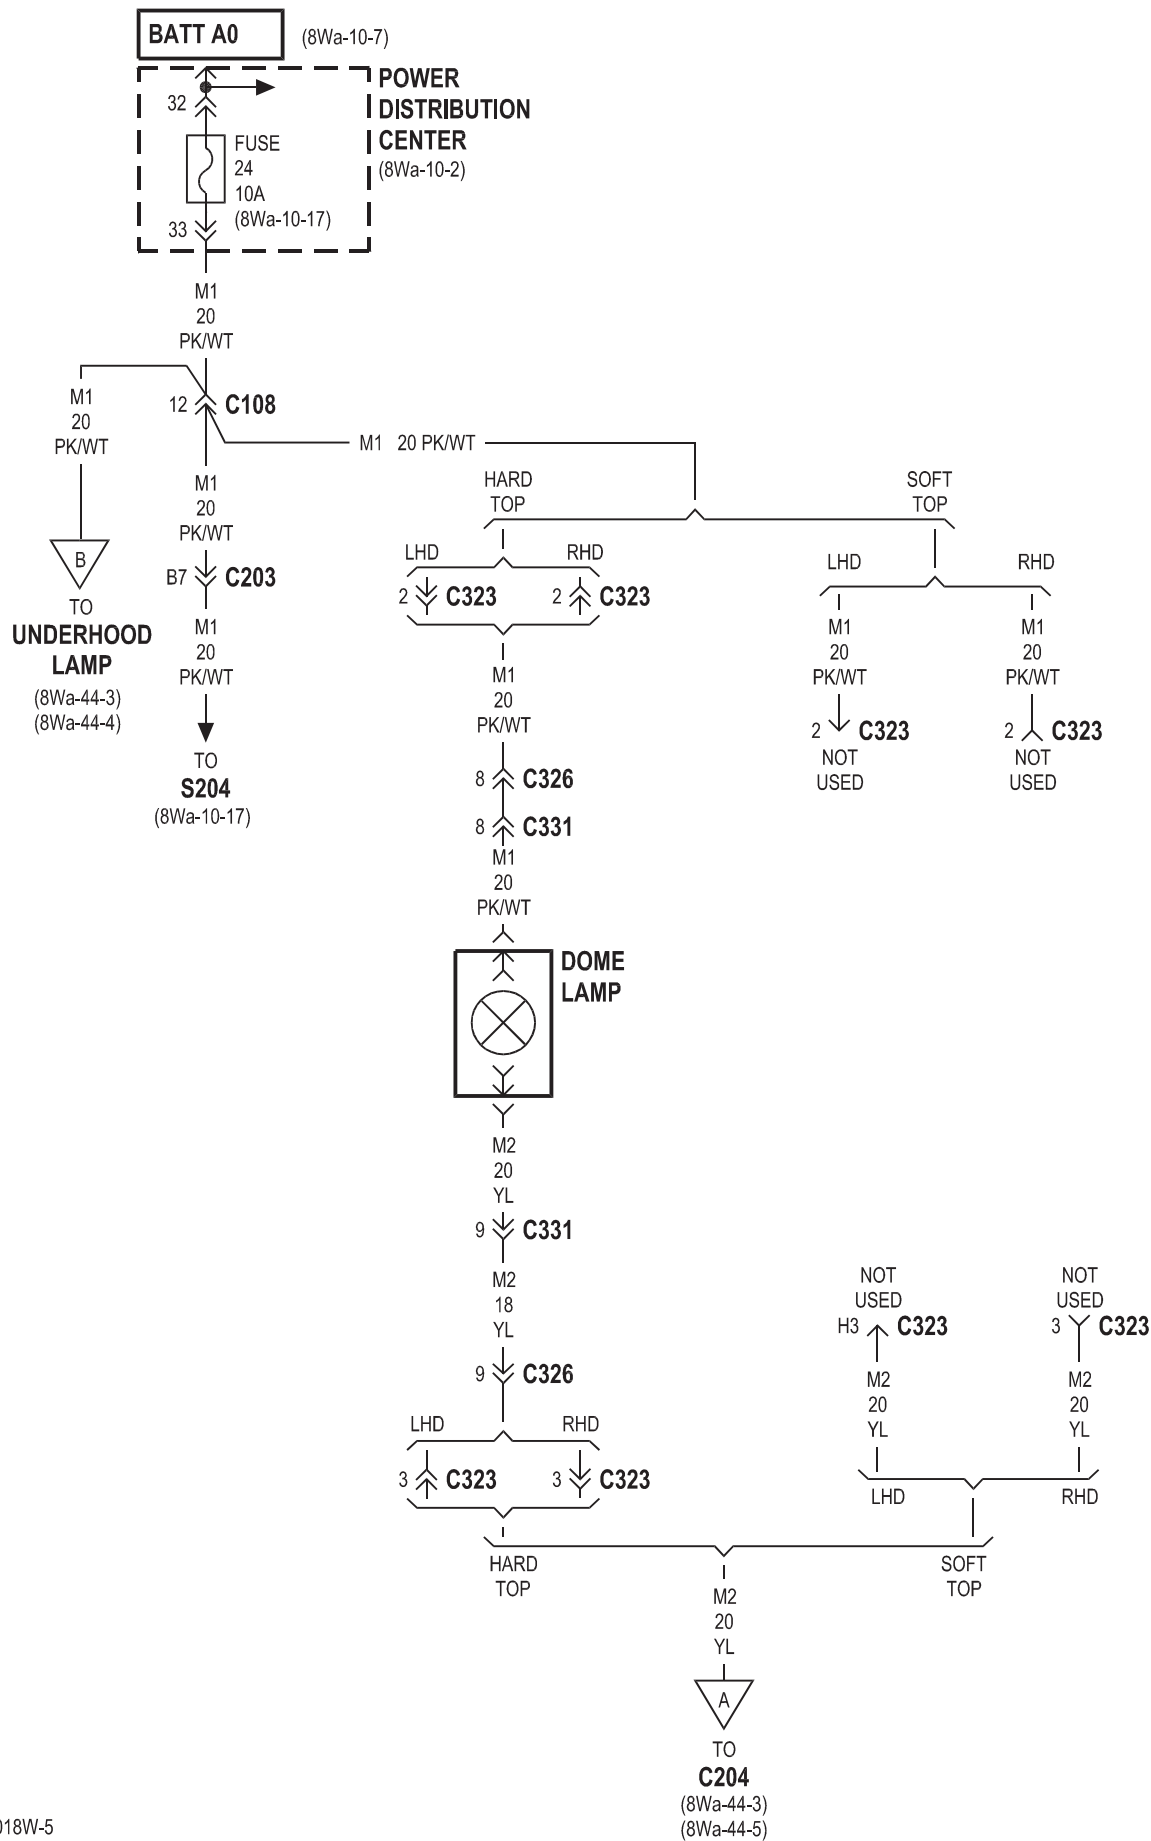

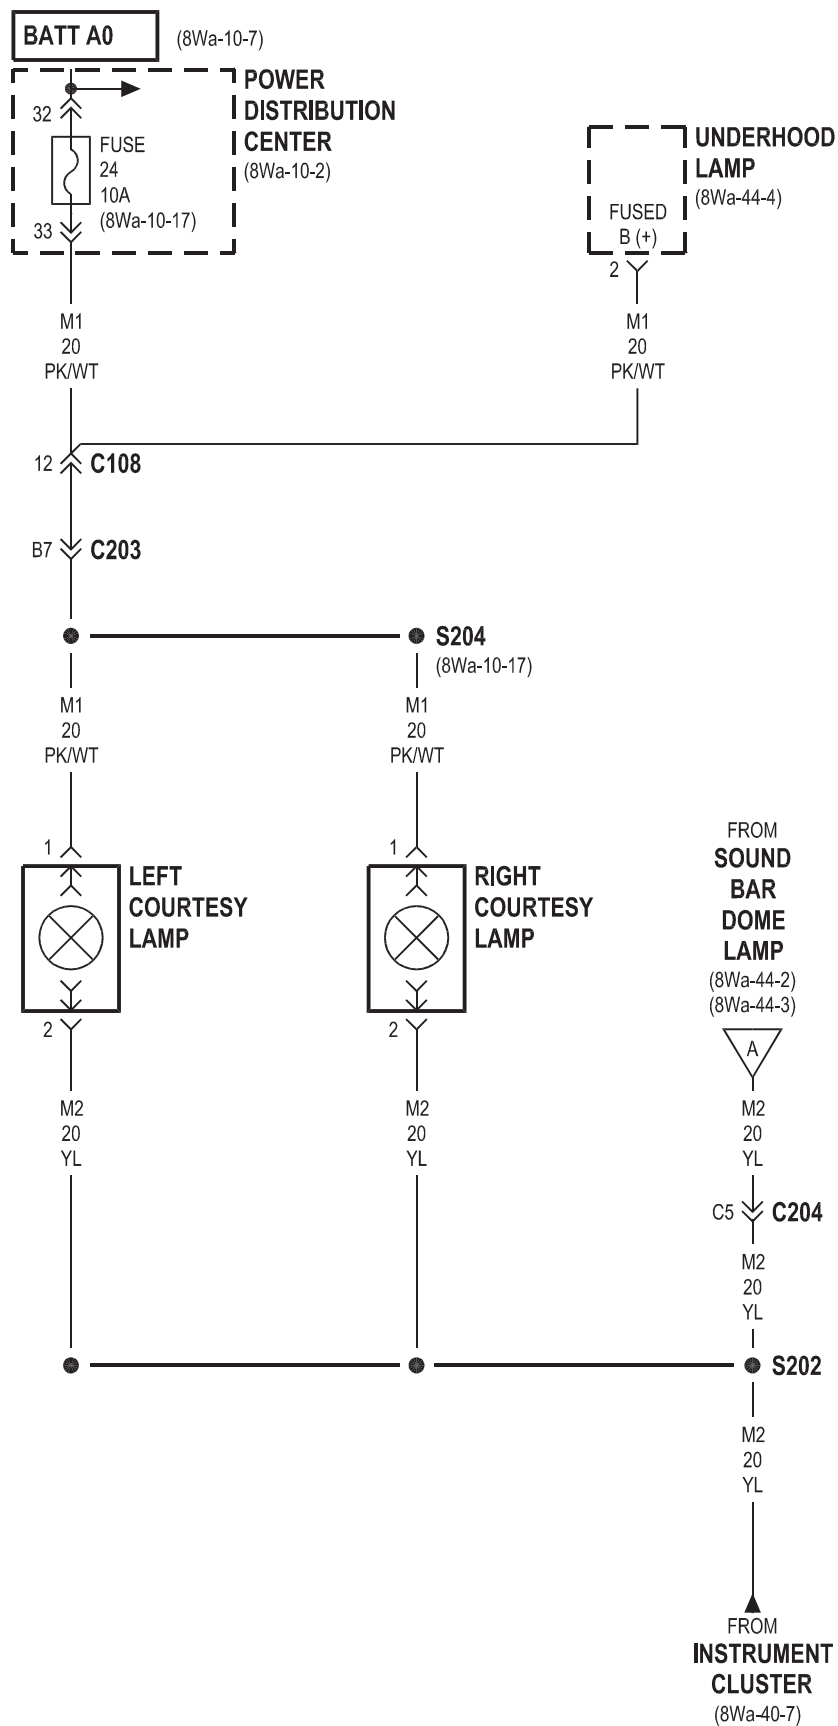

## 8W-44 INTERIOR LIGHTING

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
A/C-Heater Control . . . . .	8Wa-44-7	Instrument Cluster . . . . .	8Wa-44-5, 6, 7
Dome Lamp . . . . .	8Wa-44-2, 3	Left Courtesy Lamp . . . . .	8Wa-44-5
Driver Door Ajar Switch . . . . .	8Wa-44-6	Multi-Function Switch . . . . .	8Wa-44-7
Fuse 4 (FB) . . . . .	8Wa-44-6	Passenger Door Ajar Switch . . . . .	8Wa-44-6
Fuse 24 (PDC) . . . . .	8Wa-44-2	Power Distribution Center . . . . .	8Wa-44-2, 3, 5
Fuse 24 (PDC) . . . . .	8Wa-44-3, 5	Radio . . . . .	8Wa-44-7
Fuse Block . . . . .	8Wa-44-6	Rear Window Defogger Switch . . . . .	8Wa-44-7
G100 . . . . .	8Wa-44-4	Rear Wiper/Washer Switch . . . . .	8Wa-44-7
G200 . . . . .	8Wa-44-7	Right Courtesy Lamp . . . . .	8Wa-44-3, 5
G201 . . . . .	8Wa-44-7	Transmission Range Indicator Illumination . . . . .	8Wa-44-7
G300 . . . . .	8Wa-44-6, 7	Underhood Lamp . . . . .	8Wa-44-2, 3, 4, 5
Ignition Switch . . . . .	8Wa-44-6		

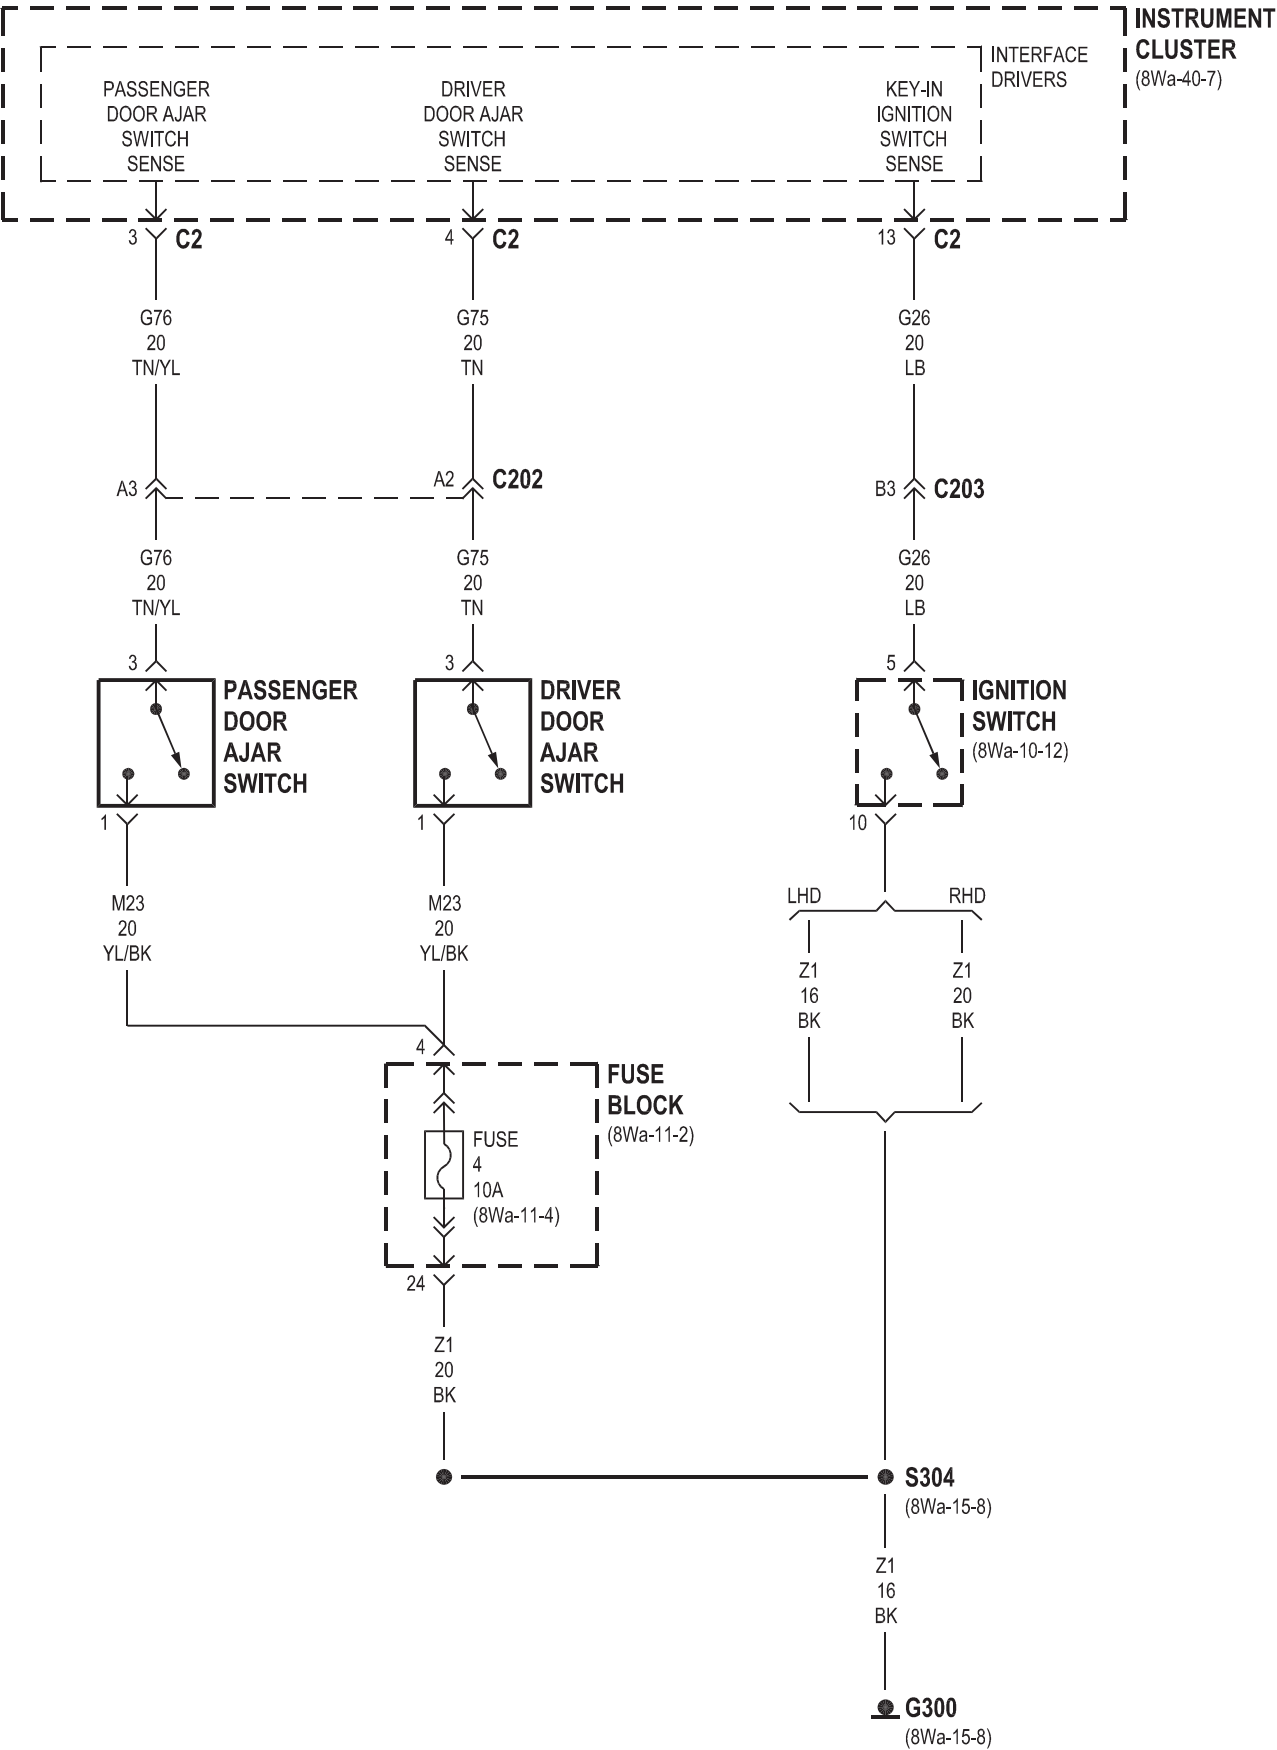

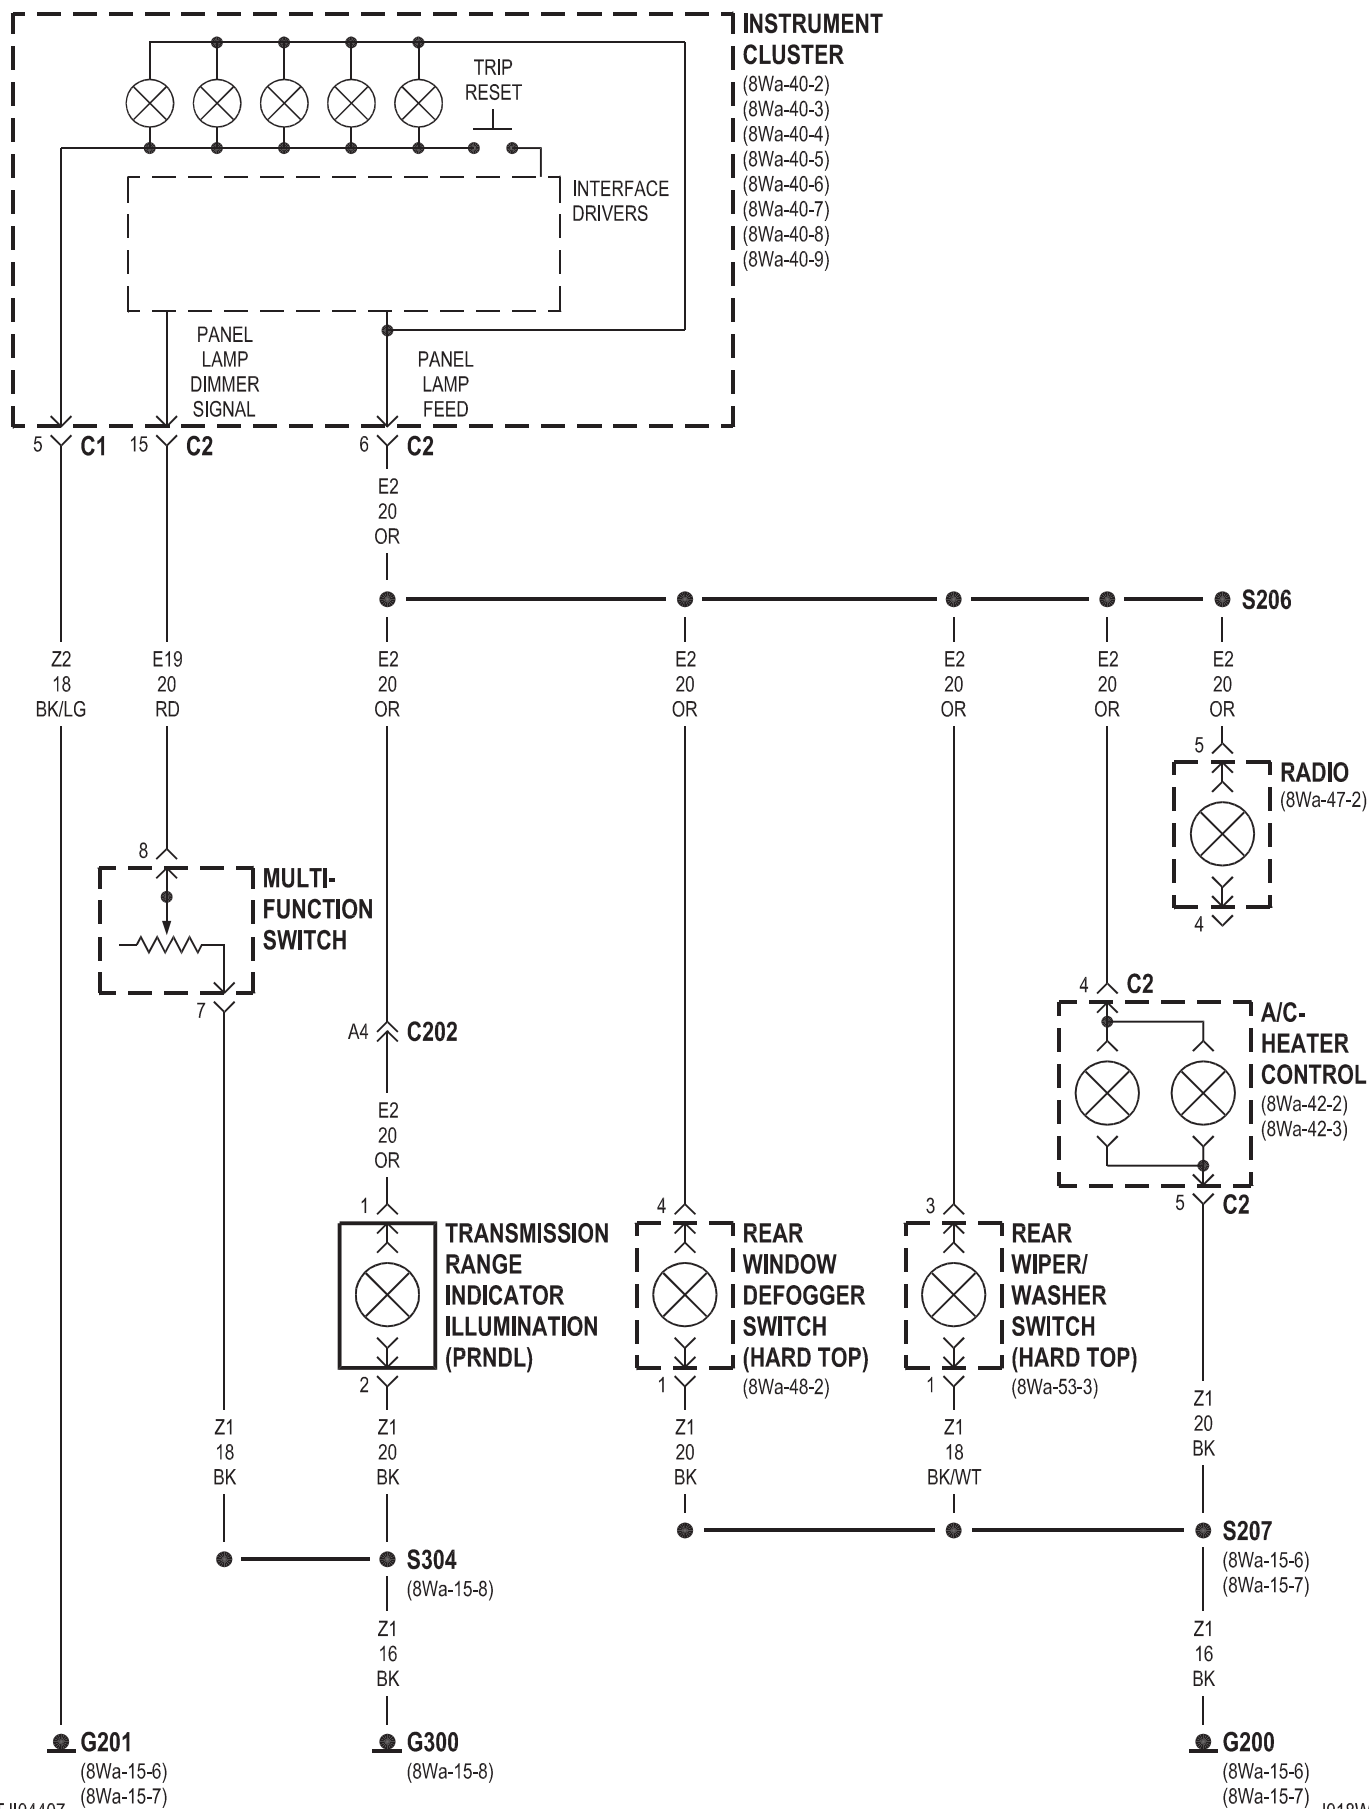

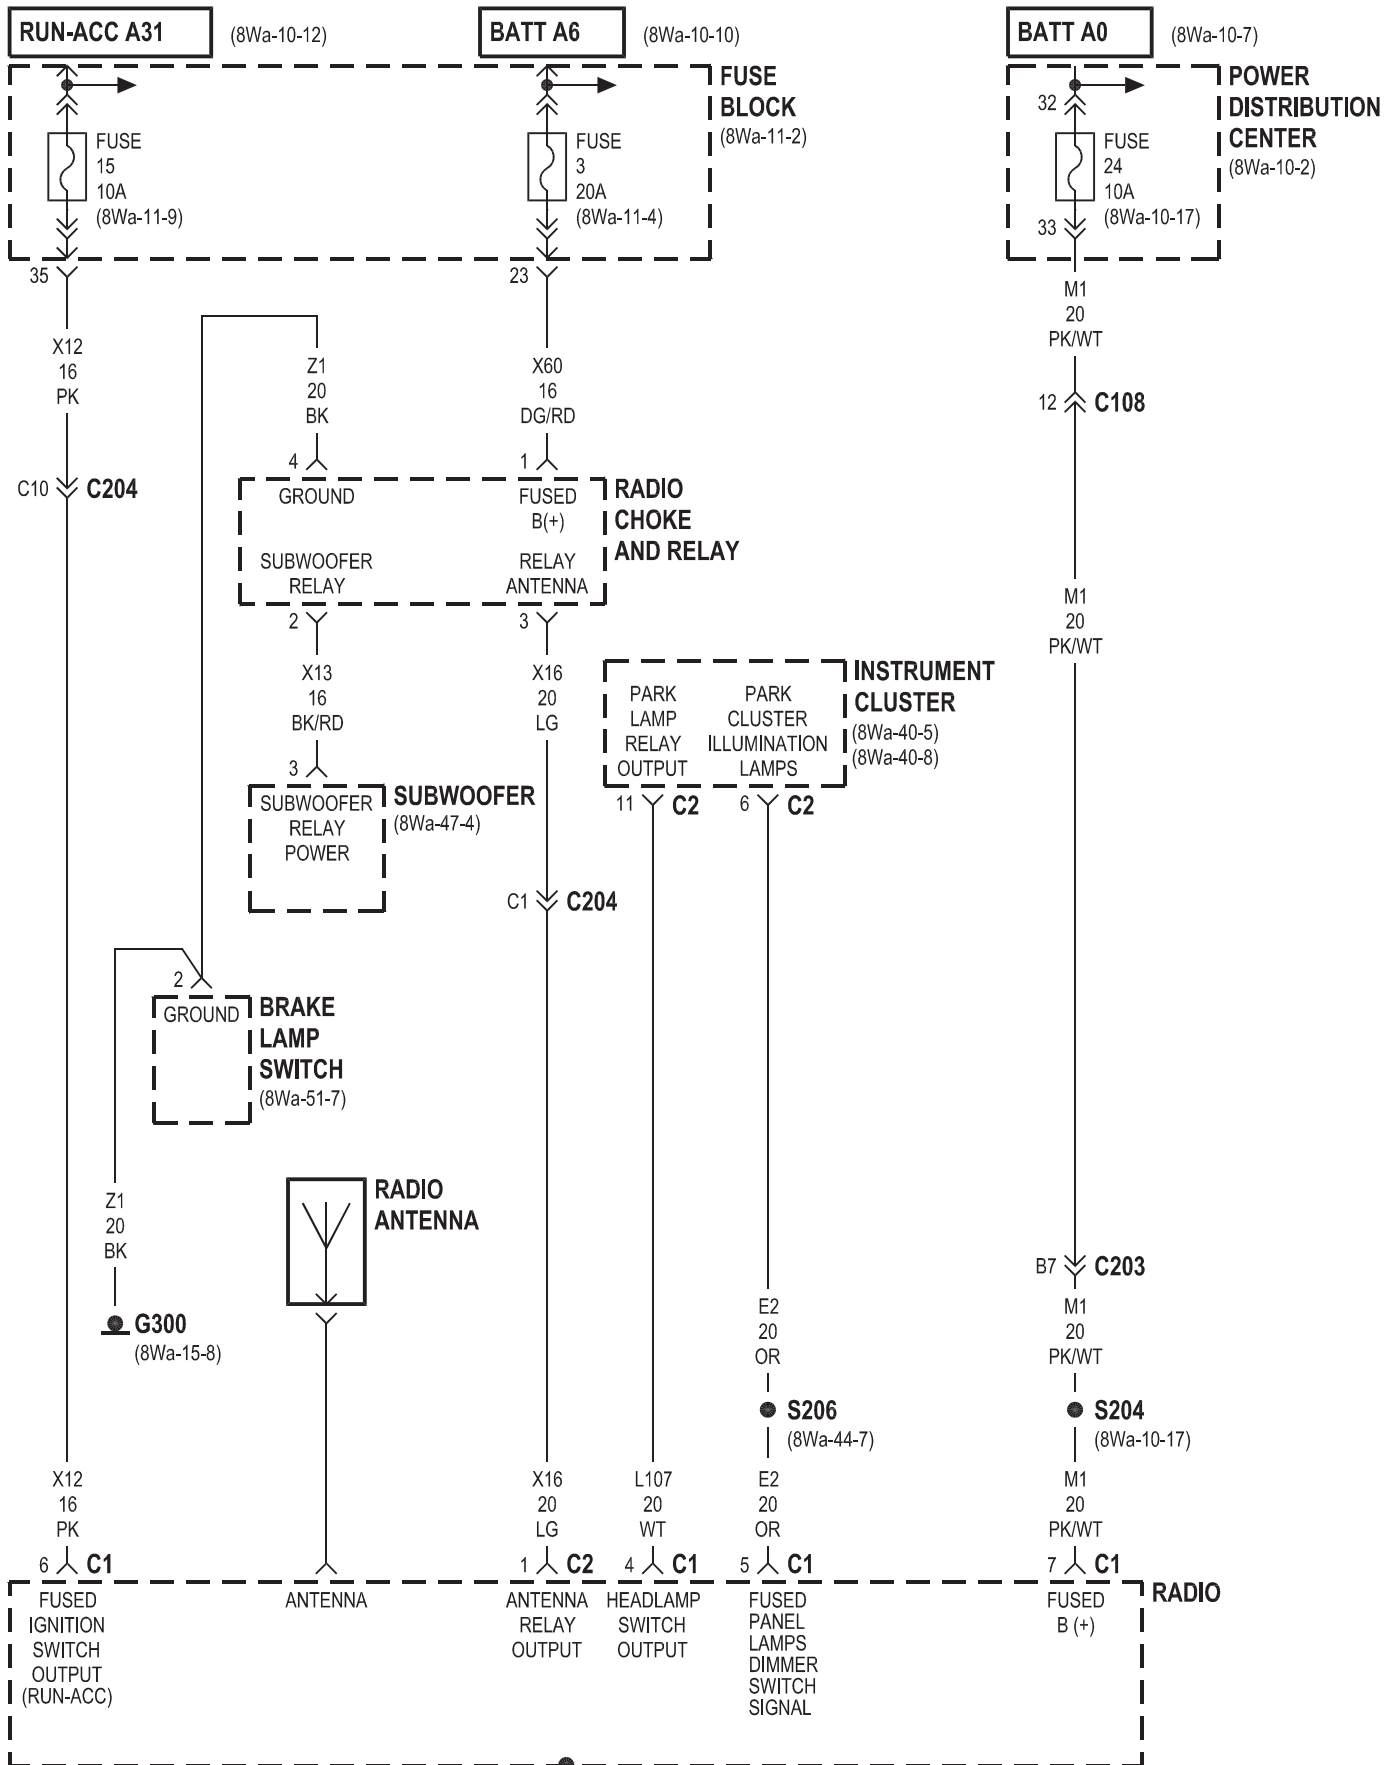

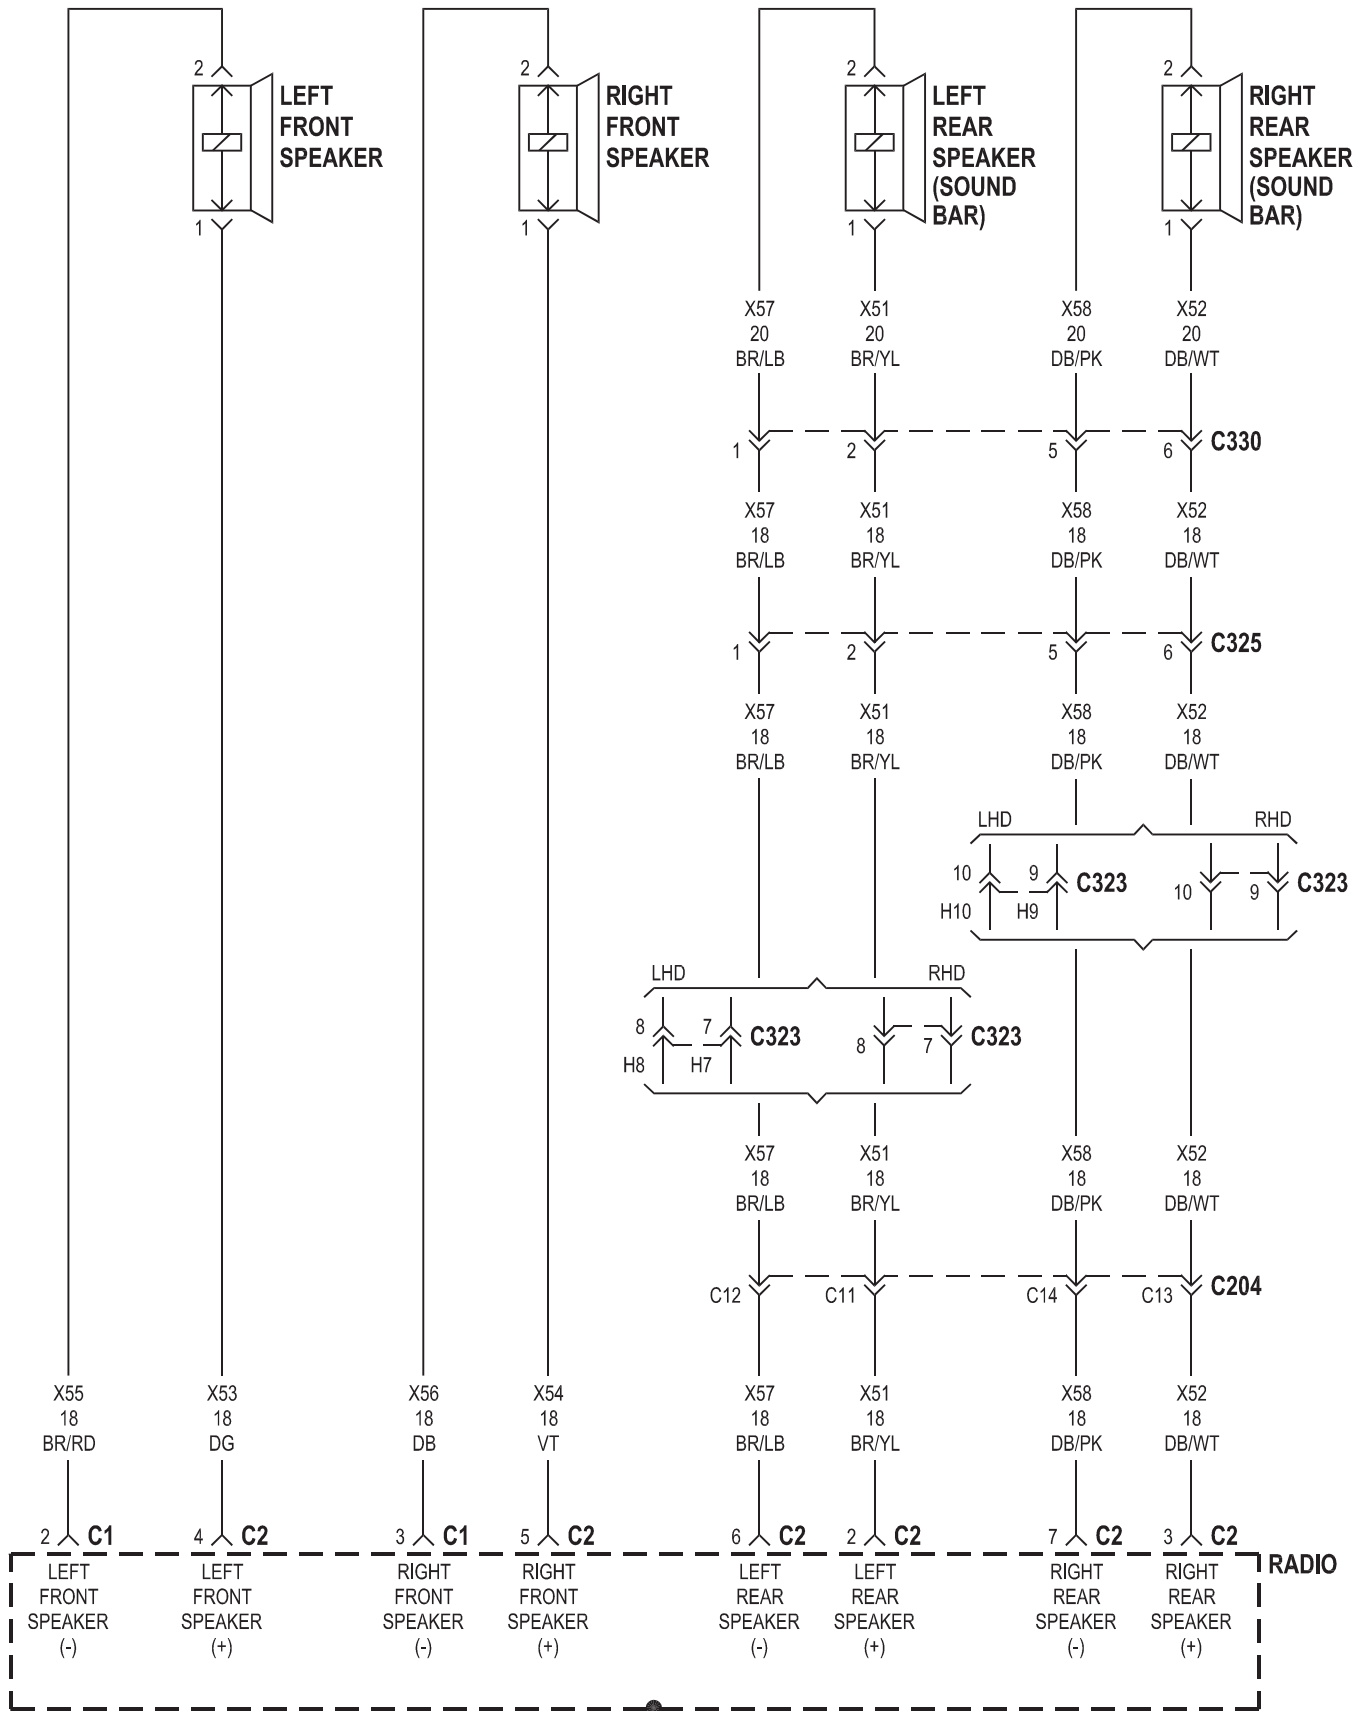

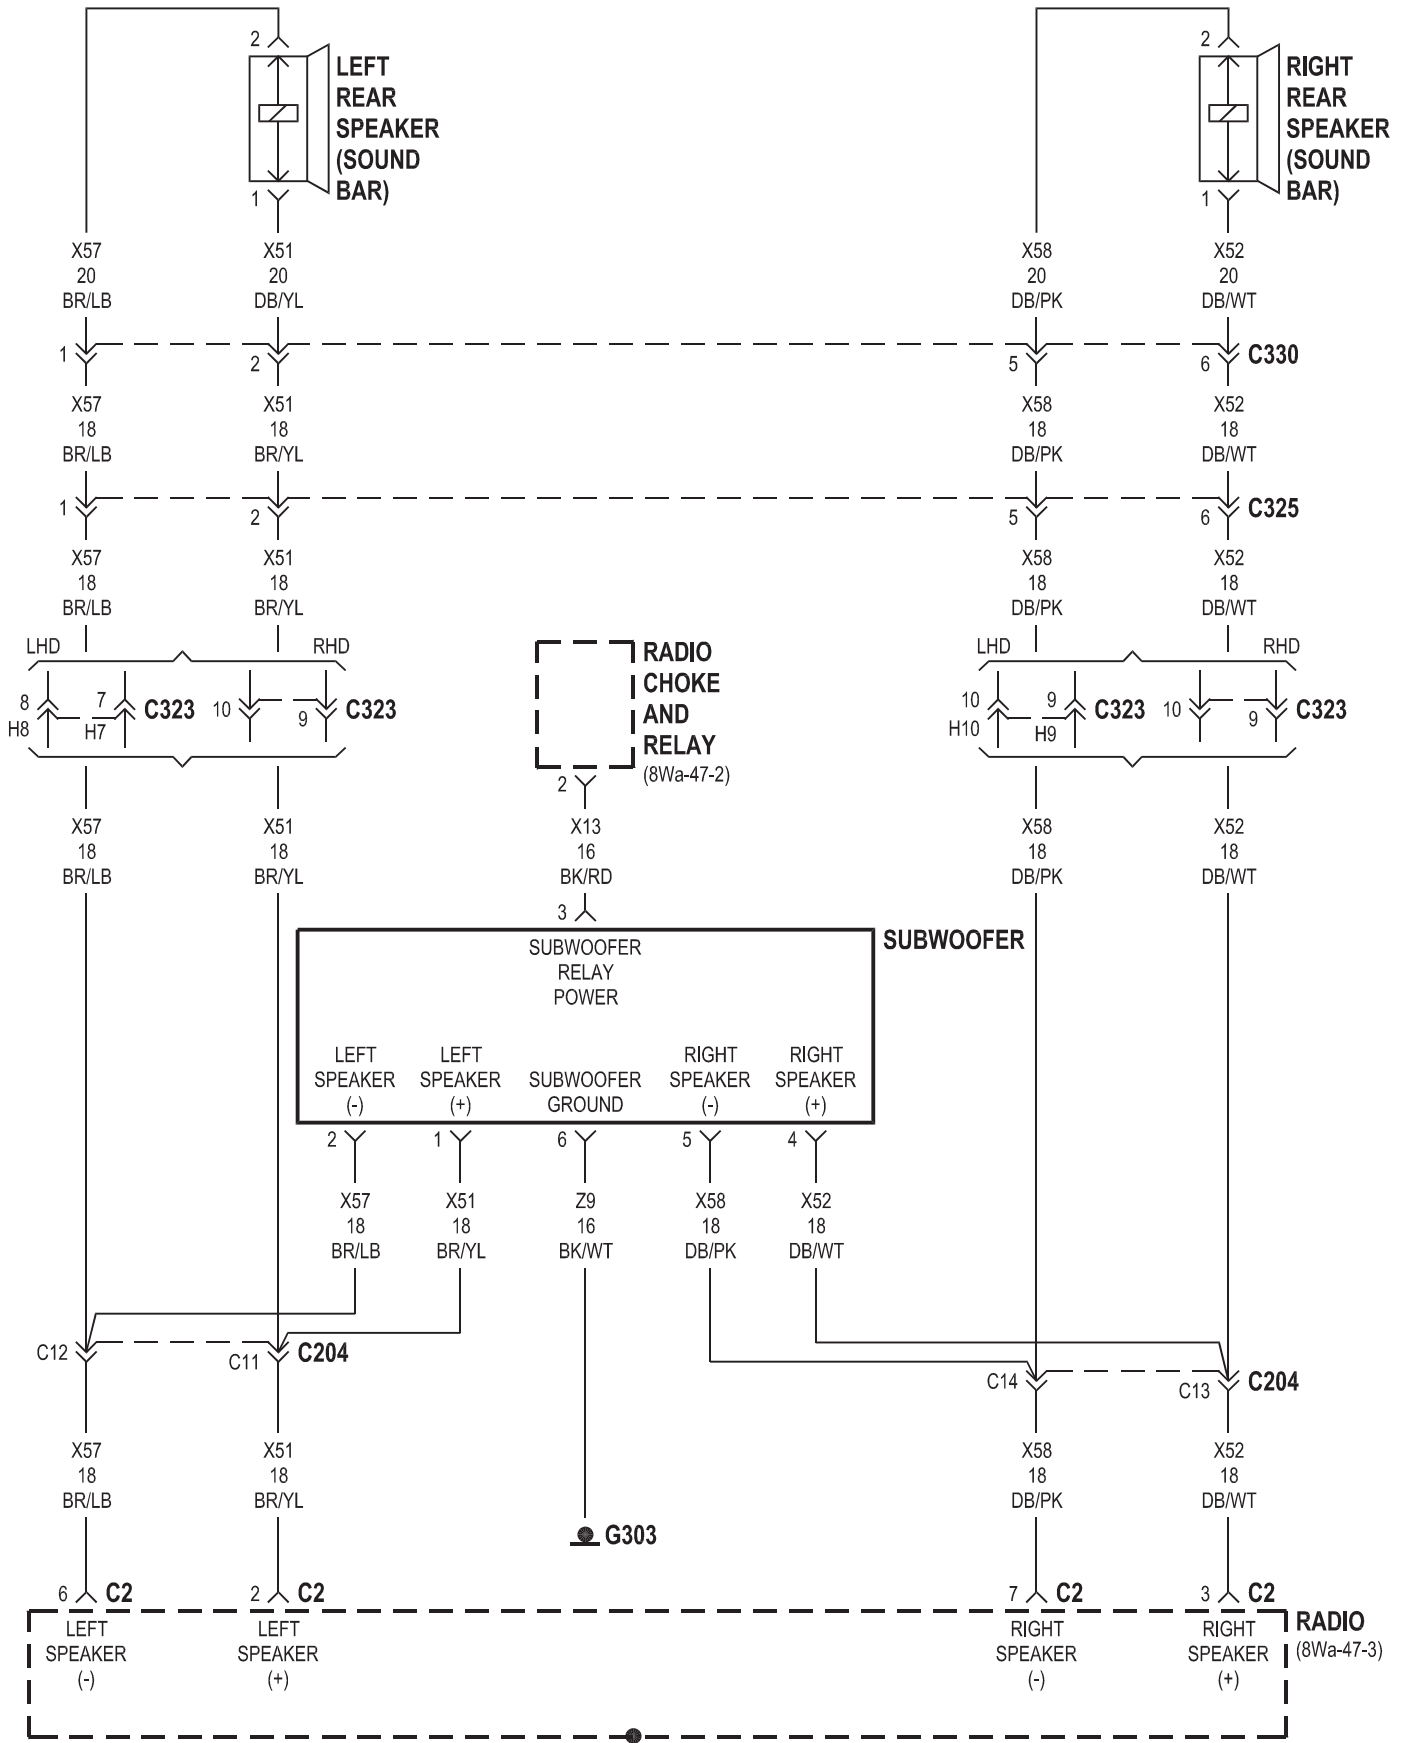

## 8W-47 AUDIO SYSTEM

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Brake Lamp Switch . . . . .	8Wa-47-2	Left Rear Speaker . . . . .	8Wa-47-3, 4
Fuse 3 (FB) . . . . .	8Wa-47-2	Power Distribution Center . . . . .	8Wa-47-2
Fuse 15 (FB) . . . . .	8Wa-47-2	Radio . . . . .	8Wa-47-2, 3, 4
Fuse 24 (PDC) . . . . .	8Wa-47-2	Radio Antenna . . . . .	8Wa-47-2
Fuse Block . . . . .	8Wa-47-2	Radio Choke And Relay . . . . .	8Wa-47-2, 4
G300 . . . . .	8Wa-47-2	Right Front Speaker . . . . .	8Wa-47-3
G303 . . . . .	8Wa-47-4	Right Rear Speaker . . . . .	8Wa-47-3, 4
Instrument Cluster . . . . .	8Wa-47-2	Subwoofer . . . . .	8Wa-47-2, 4
Left Front Speaker . . . . .	8Wa-47-3		

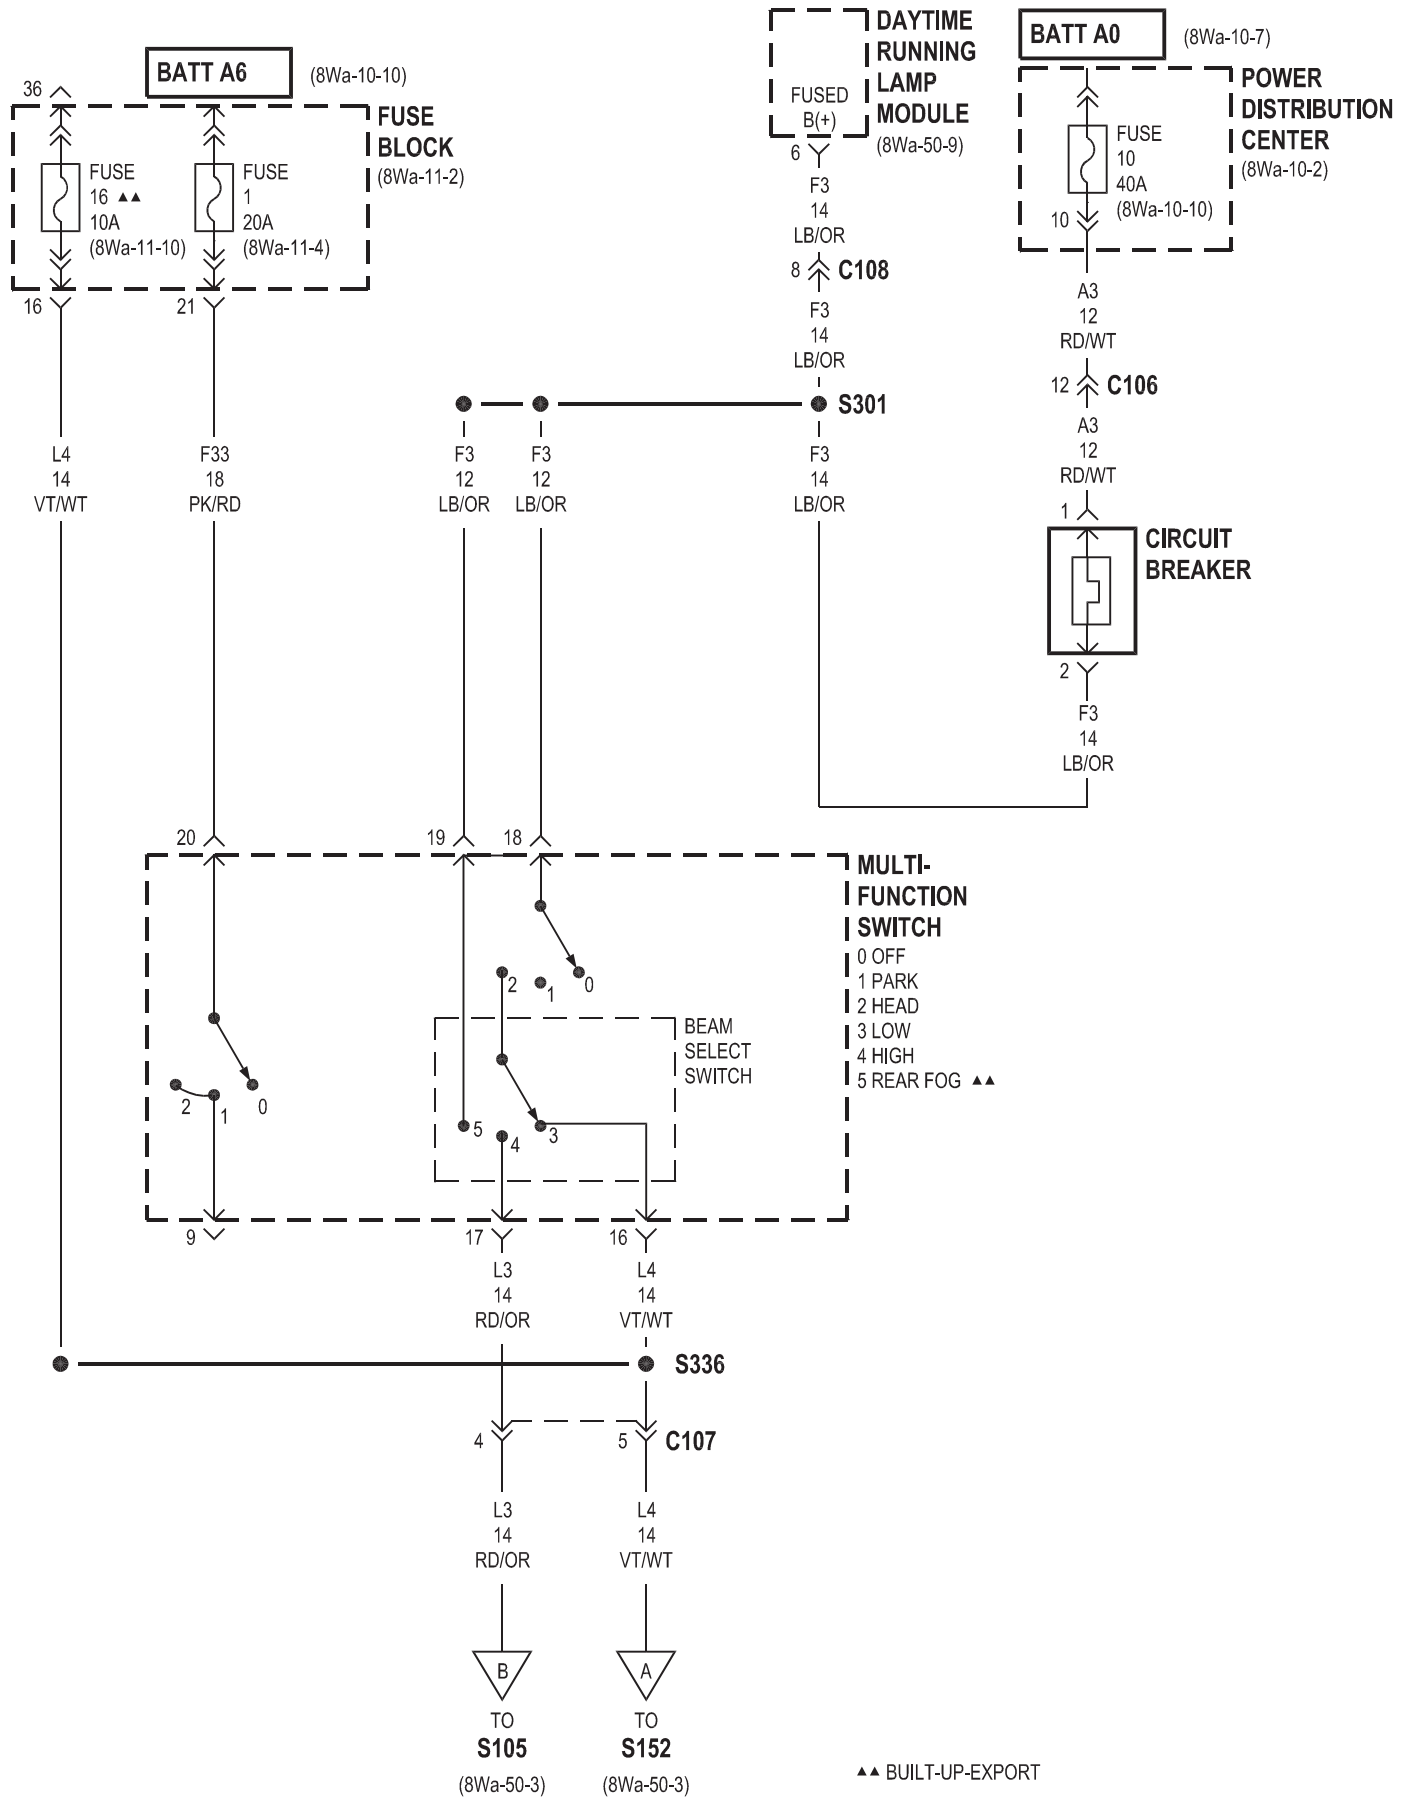

## 8W-48 REAR WINDOW DEFOGGER

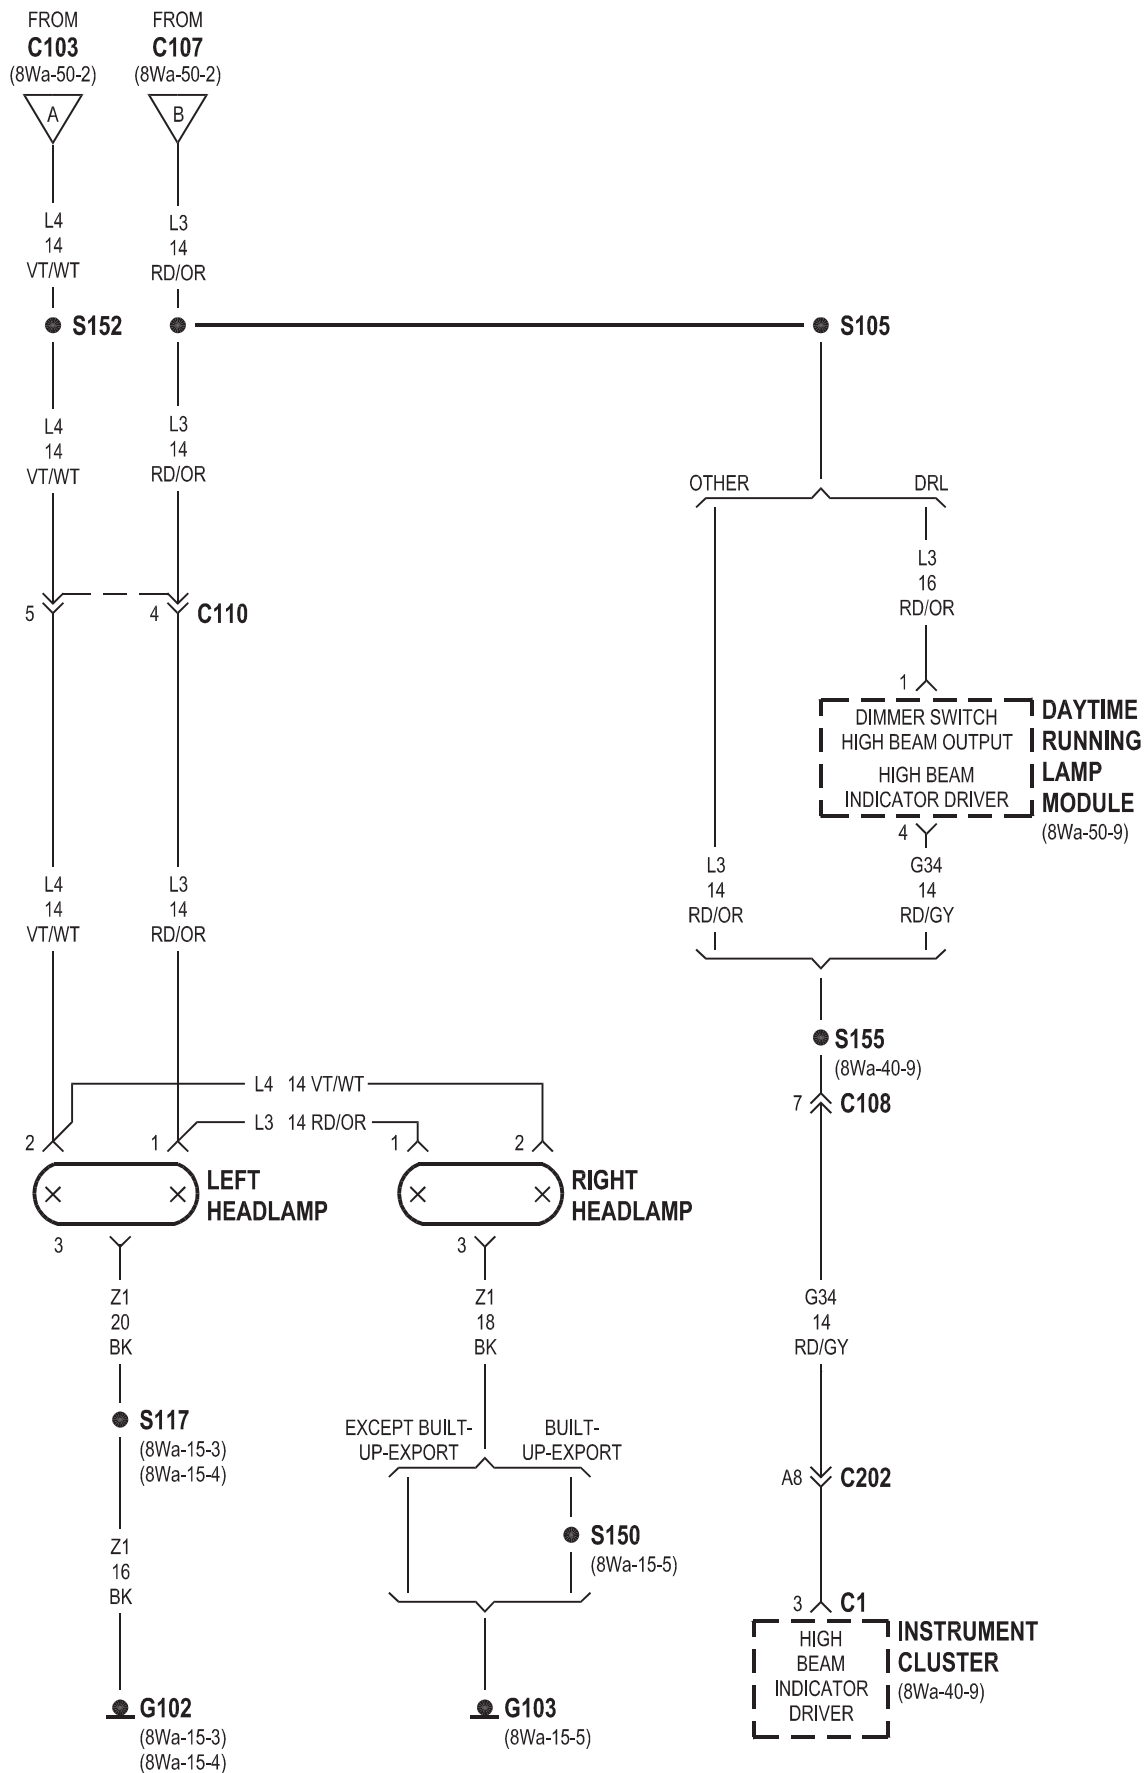

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Fuse 7 (FB) . . . . .	8Wa-48-2	Instrument Cluster . . . . .	8Wa-48-2
Fuse 17 (FB) . . . . .	8Wa-48-2	Power Distribution Center . . . . .	8Wa-48-2
Fuse 2 (PDC) . . . . .	8Wa-48-2	Rear Window Defogger . . . . .	8Wa-48-2
Fuse Block . . . . .	8Wa-48-2	Rear Window Defogger Relay . . . . .	8Wa-48-2
G200 . . . . .	8Wa-48-2	Rear Window Defogger Switch . . . . .	8Wa-48-2
G302 . . . . .	8Wa-48-2		

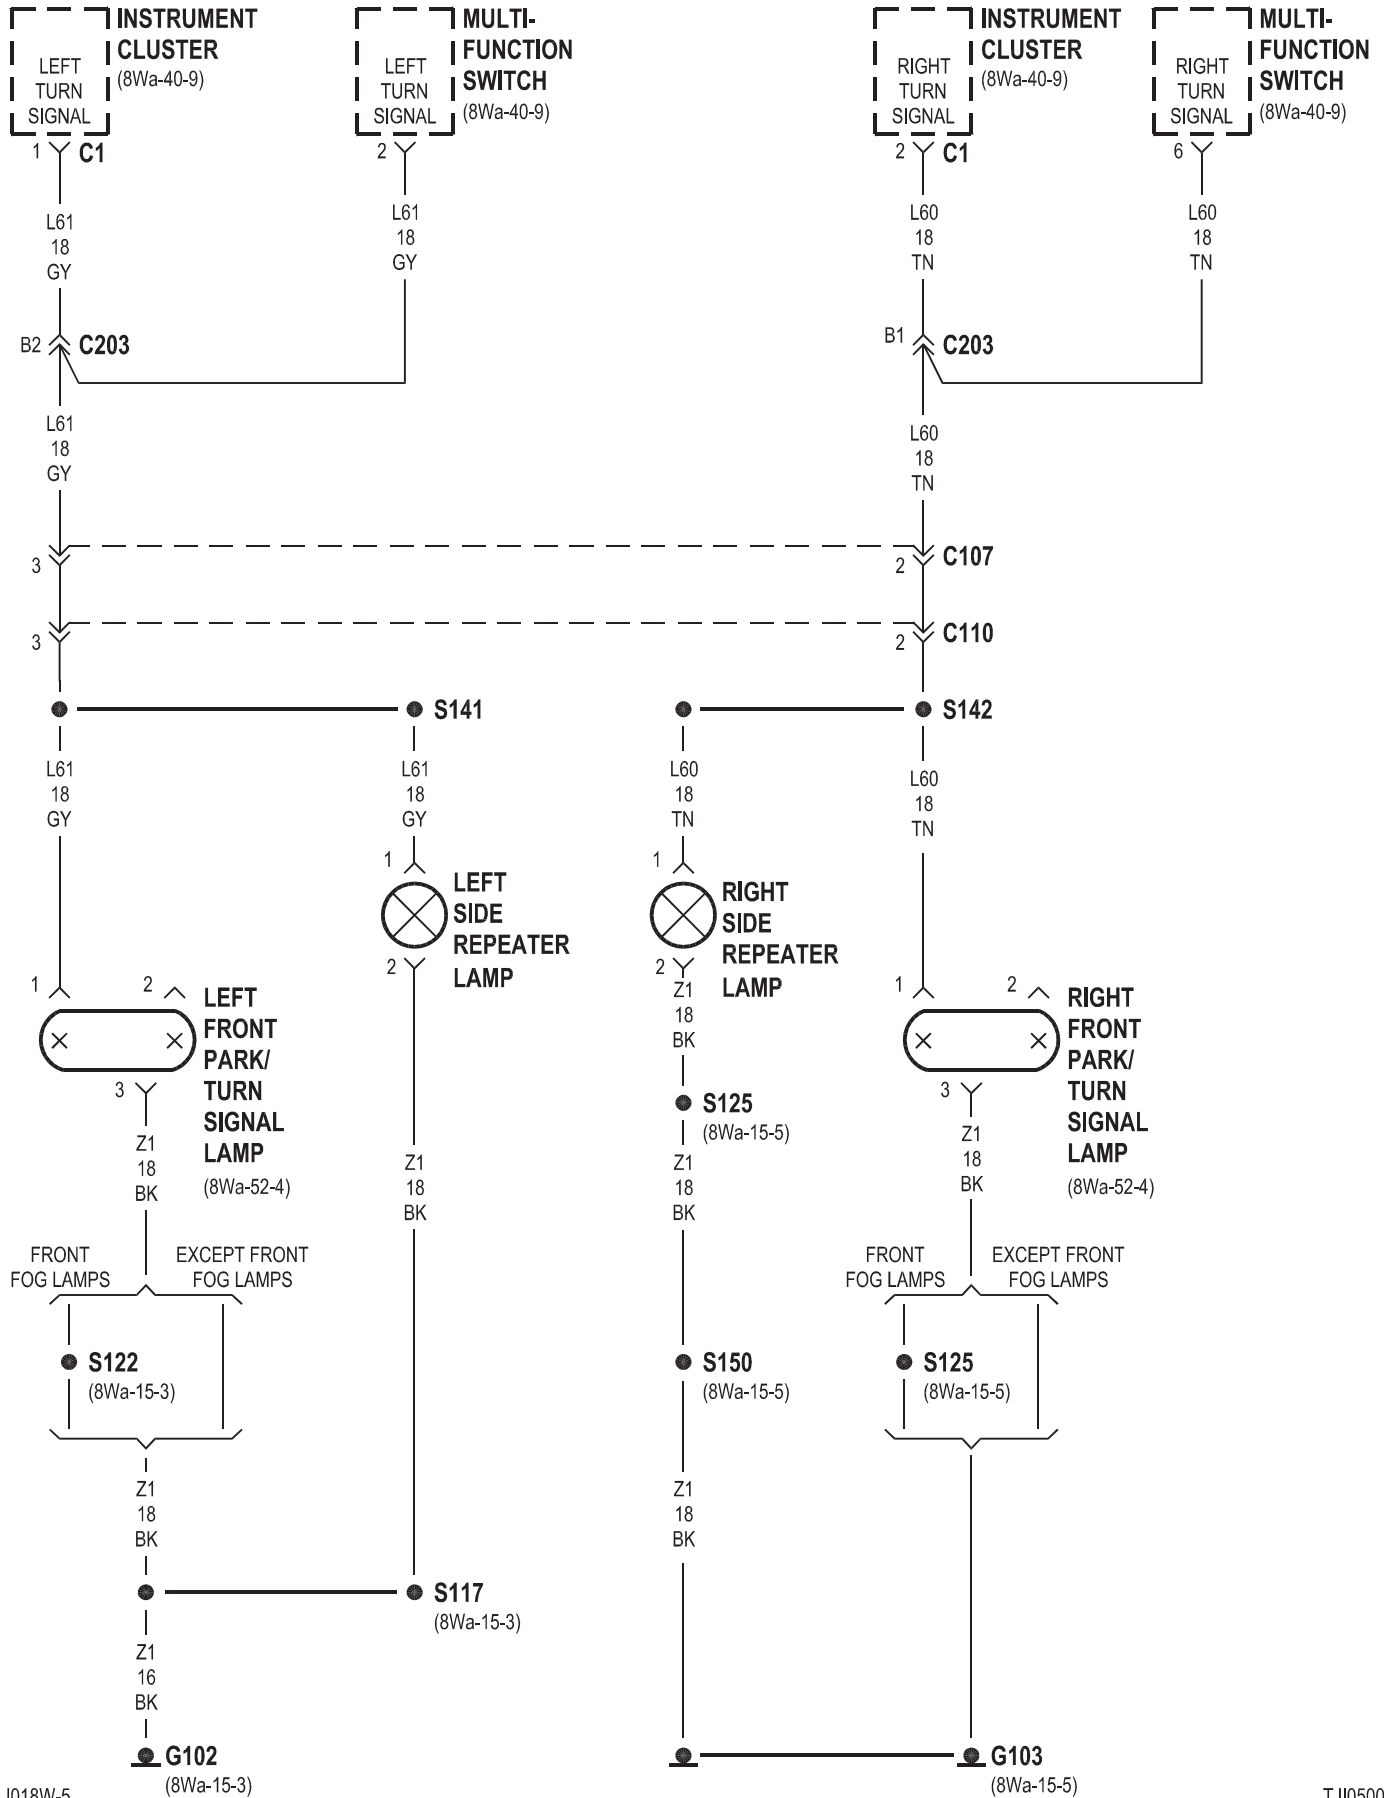

## 8W-50 FRONT LIGHTING

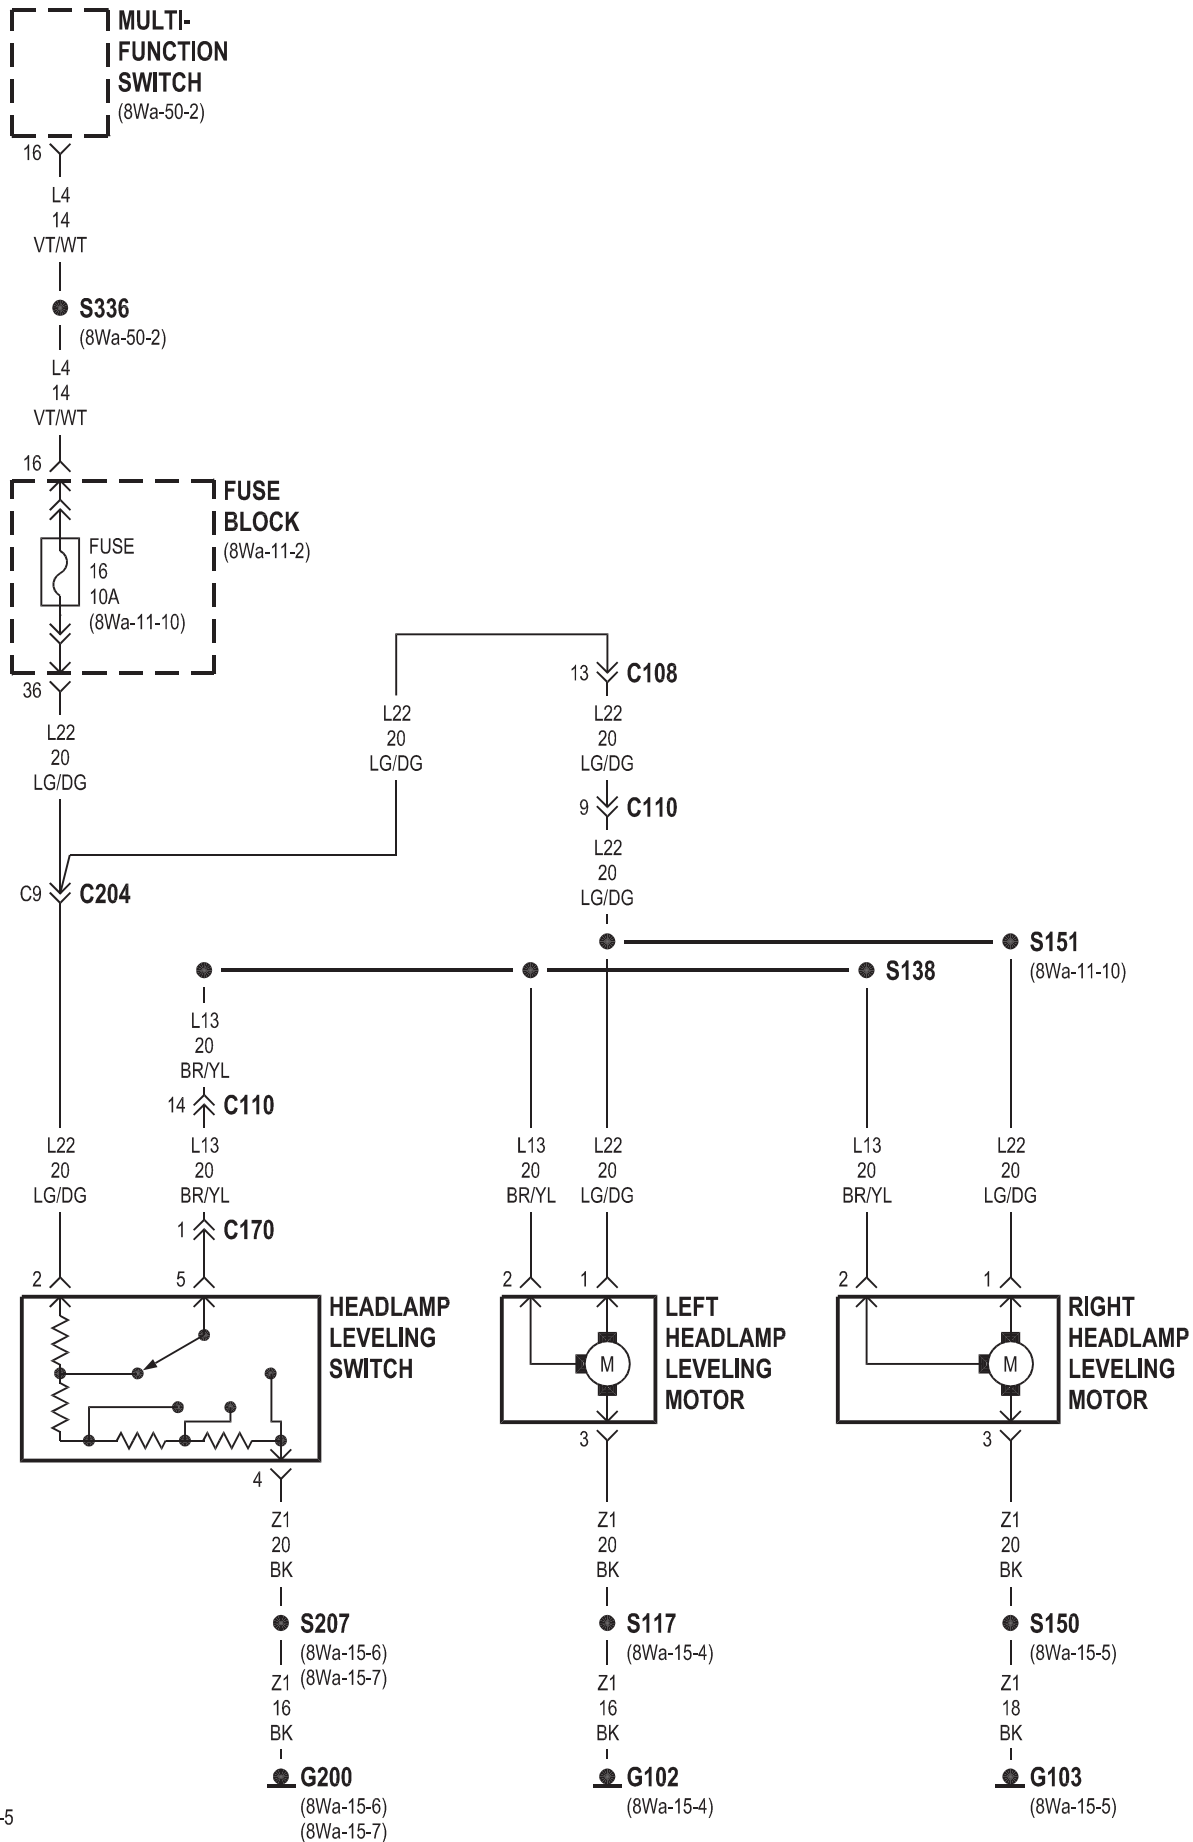

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Beam Select Switch . . . . .	8Wa-50-2	Left Fog Lamp . . . . .	8Wa-50-7, 8
Circuit Breaker . . . . .	8Wa-50-2	Left Front Park/Turn Signal Lamp . . . . .	8Wa-50-4
Daytime Running Lamp Module . .	8Wa-50-2, 3, 8, 9	Left Front Position Lamp . . . . .	8Wa-50-5
Fog Lamp Relay . . . . .	8Wa-50-7, 8	Left Headlamp . . . . .	8Wa-50-3, 9
Fuse 1 (FB) . . . . .	8Wa-50-2	Left Headlamp Leveling Motor . . . . .	8Wa-50-6
Fuse 11 (FB) . . . . .	8Wa-50-9	Left Side Repeater Lamp . . . . .	8Wa-50-4
Fuse 16 (FB) . . . . .	8Wa-50-2, 6	Multi- Function Switch . . . . .	8Wa-50-2, 4, 6, 7, 8, 9
Fuse 10 (PDC) . . . . .	8Wa-50-2	Power Distribution Center . . . . .	8Wa-50-2, 7, 8
Fuse 19 (PDC) . . . . .	8Wa-50-7, 8	Powertrain Control Module . . . . .	8Wa-50-9
Fuse Block . . . . .	8Wa-50-2, 6, 9	Right Fog Lamp . . . . .	8Wa-50-7, 8
G100 . . . . .	8Wa-50-7, 8, 9	Right Front Park/Turn Signal Lamp . . . . .	8Wa-50-4
G102 . . . . .	8Wa-50-3, 4, 5, 6, 7, 8	Right Front Position Lamp . . . . .	8Wa-50-5
G103 . . . . .	8Wa-50-3, 4, 5, 6, 7, 8	Right Headlamp . . . . .	8Wa-50-3, 9
G200 . . . . .	8Wa-50-6	Right Headlamp Leveling Motor . . . . .	8Wa-50-6
Headlamp Leveling Switch . . . . .	8Wa-50-6	Right Side Repeater Lamp . . . . .	8Wa-50-4
Instrument Cluster . . . . .	8Wa-50-3, 4, 5, 7, 8, 9	Vehicle Speed Sensor . . . . .	8Wa-50-9

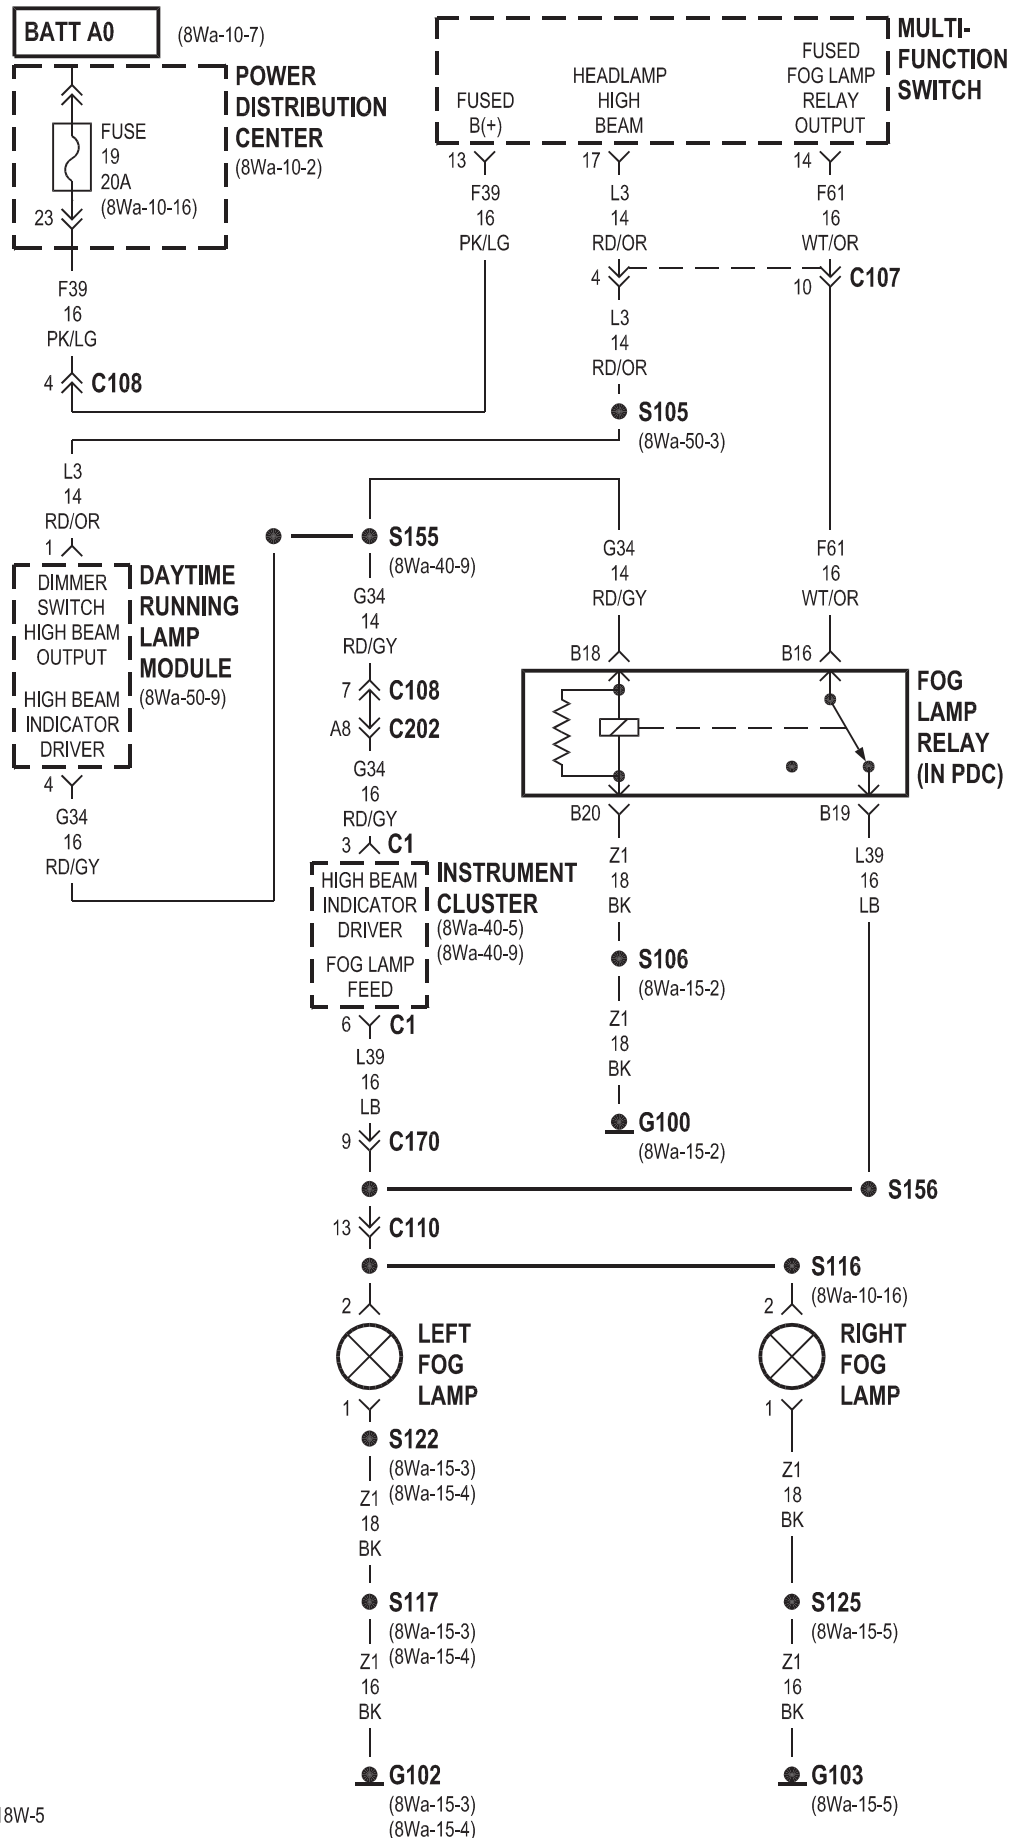

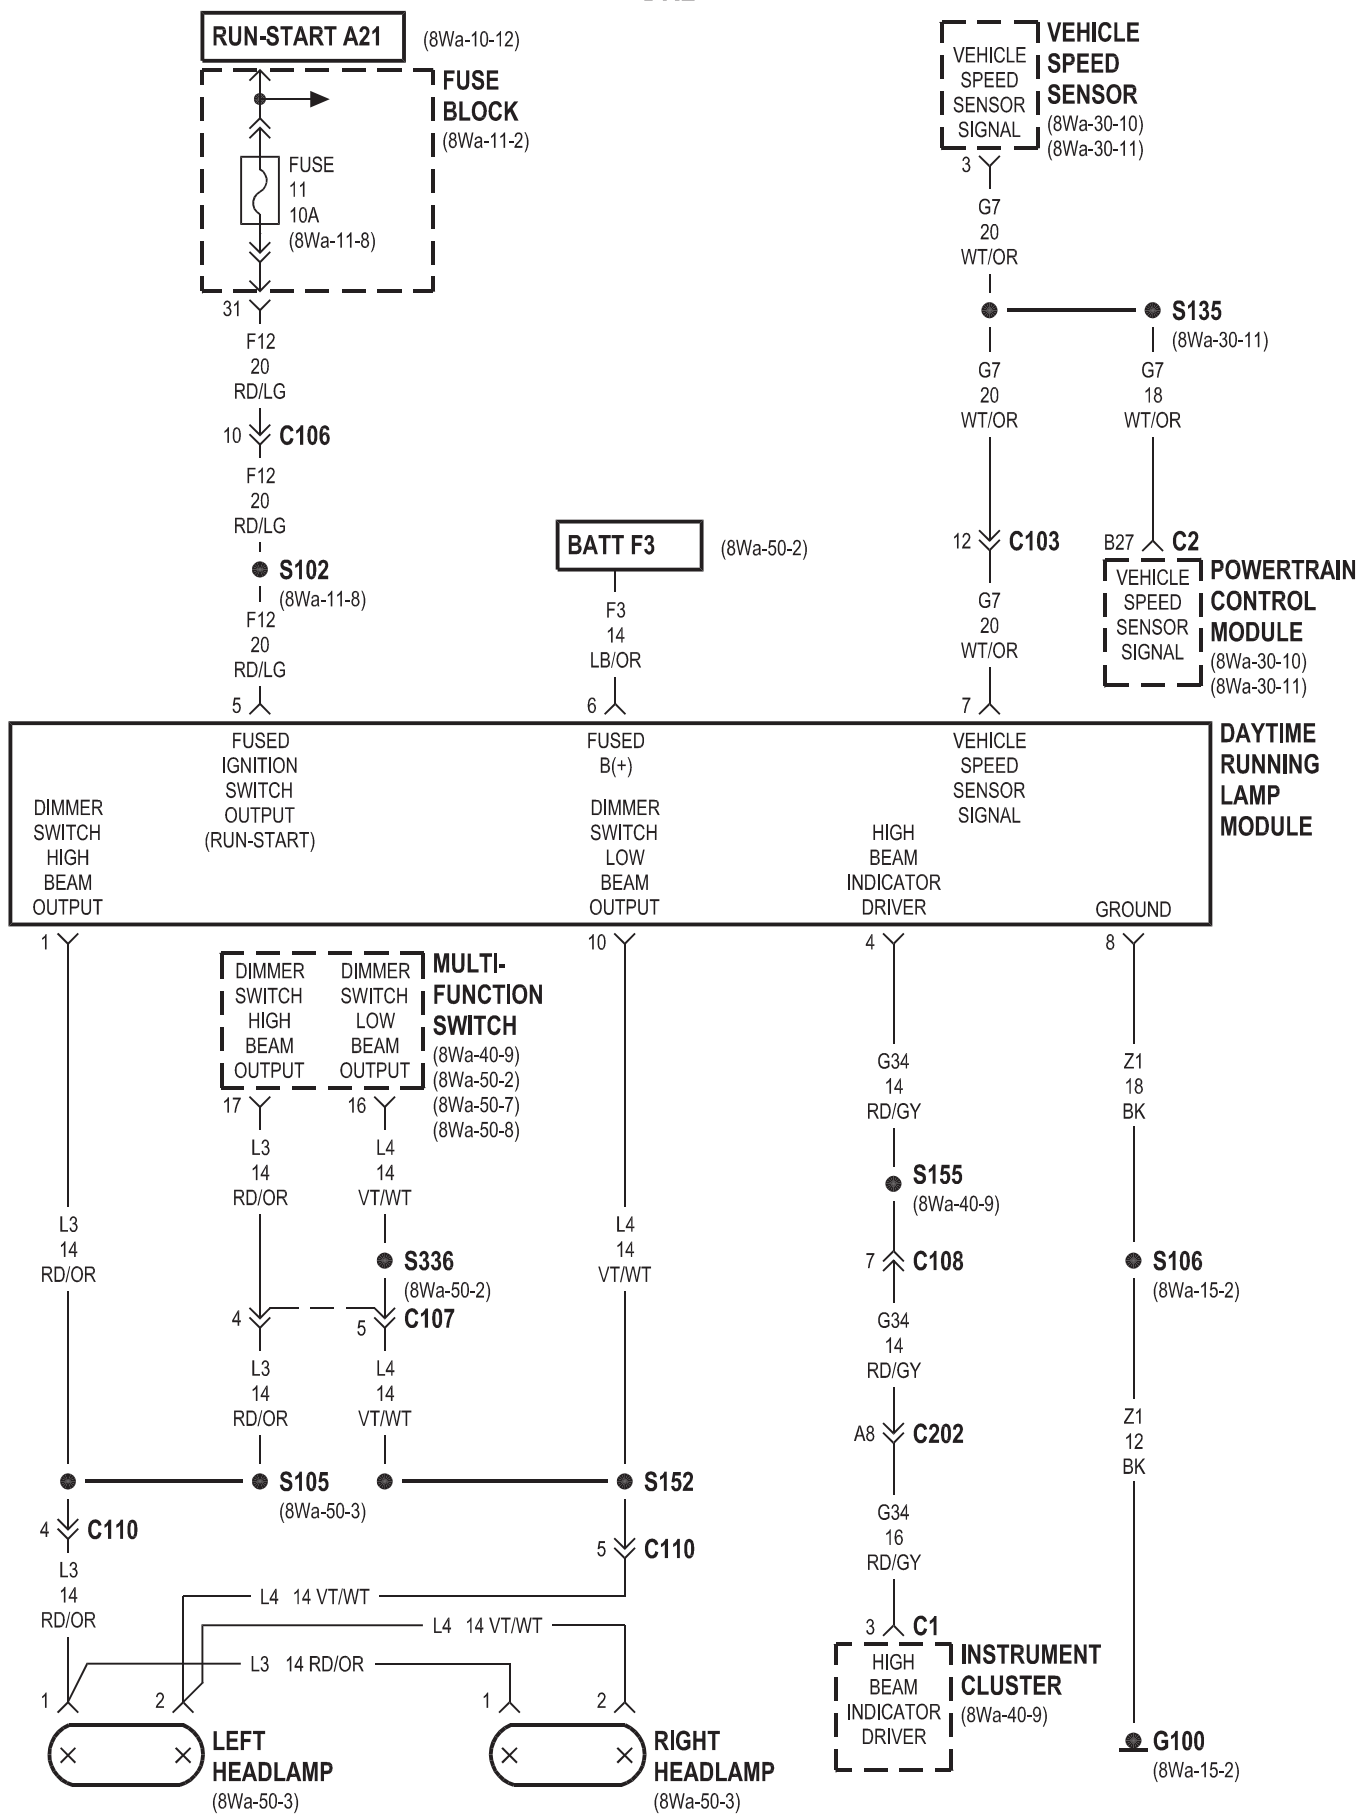

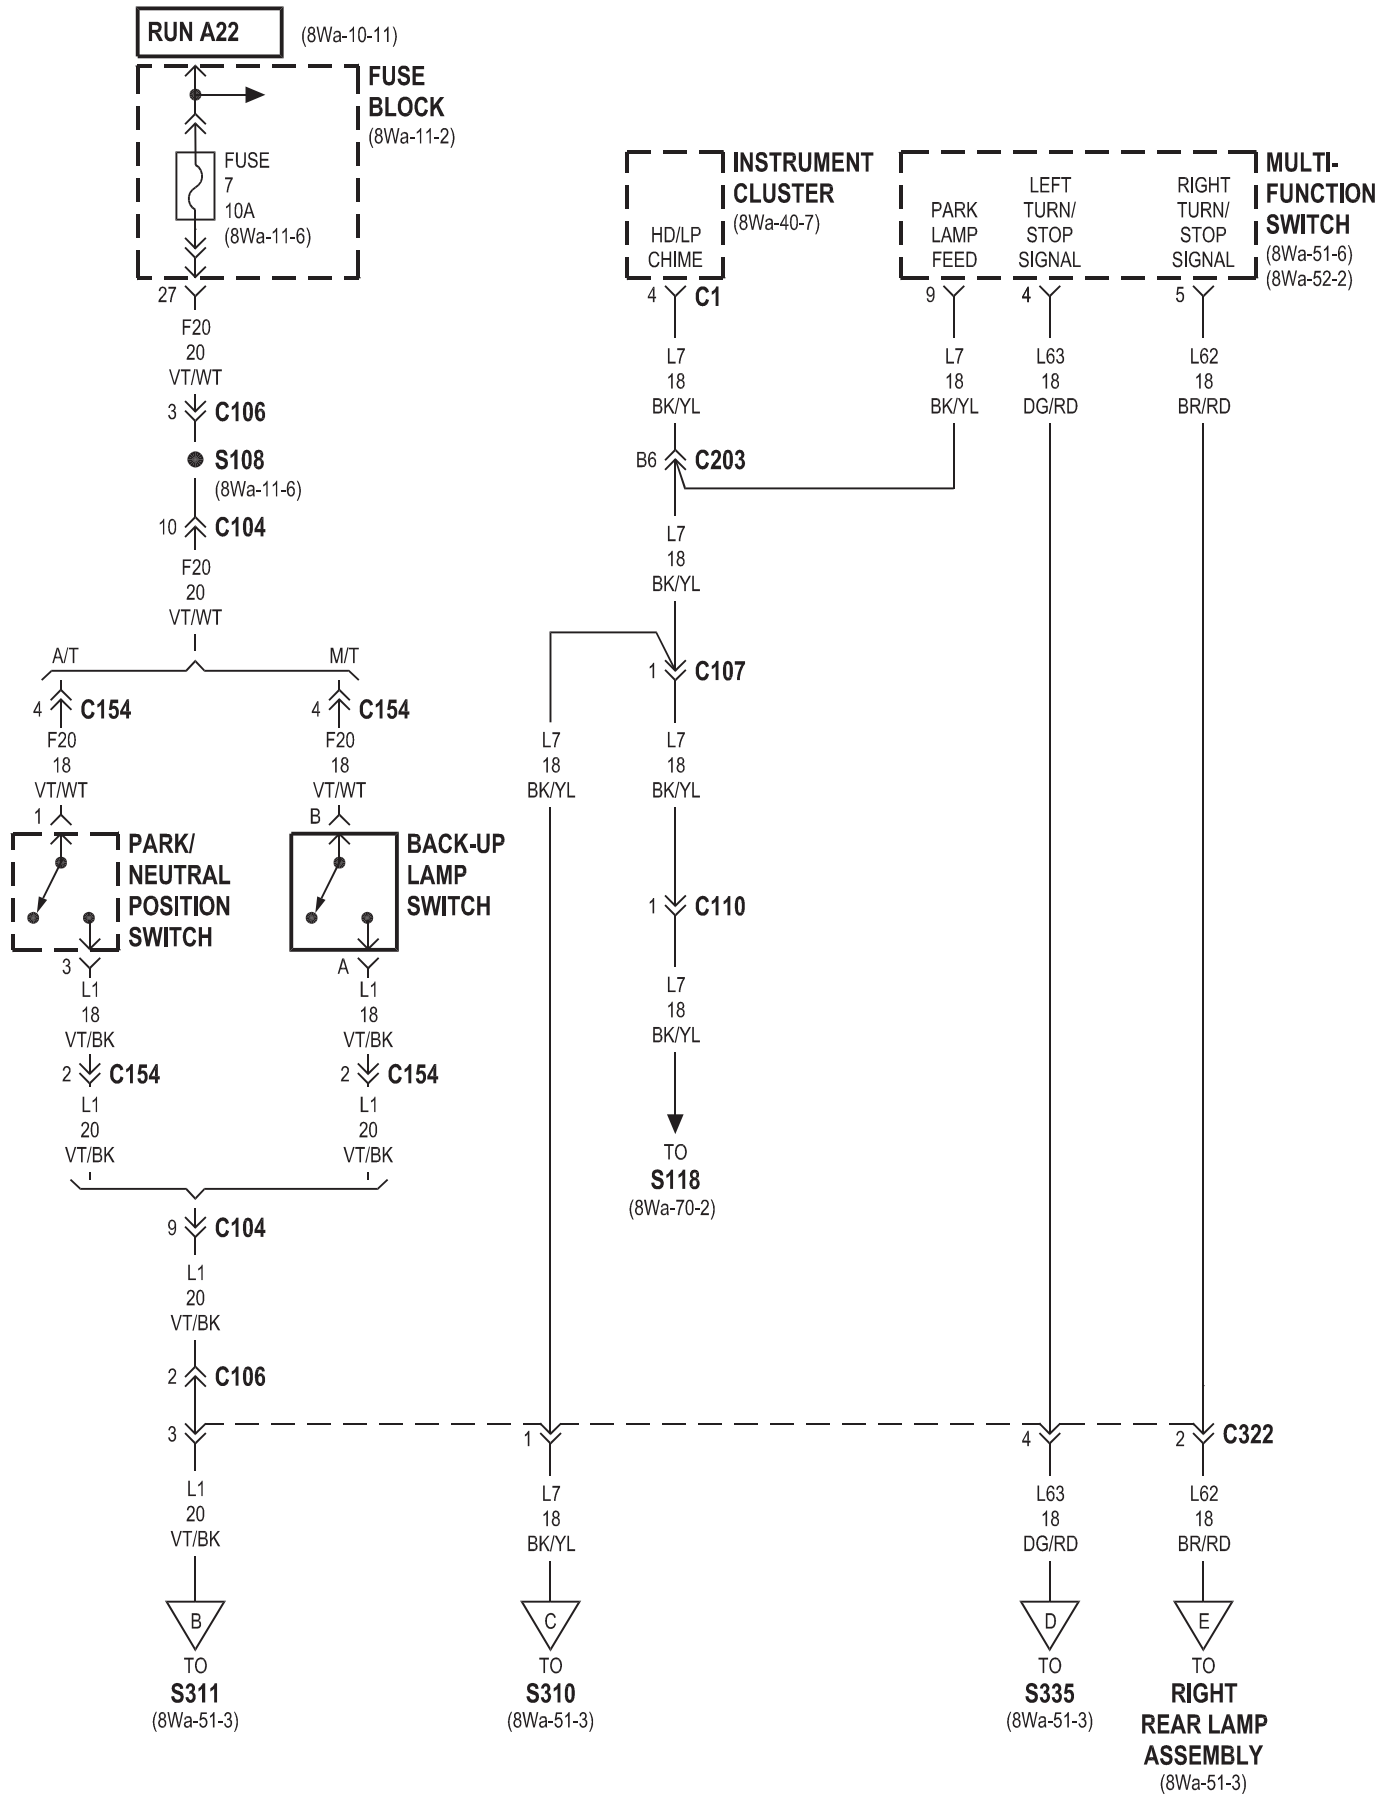

## DRL

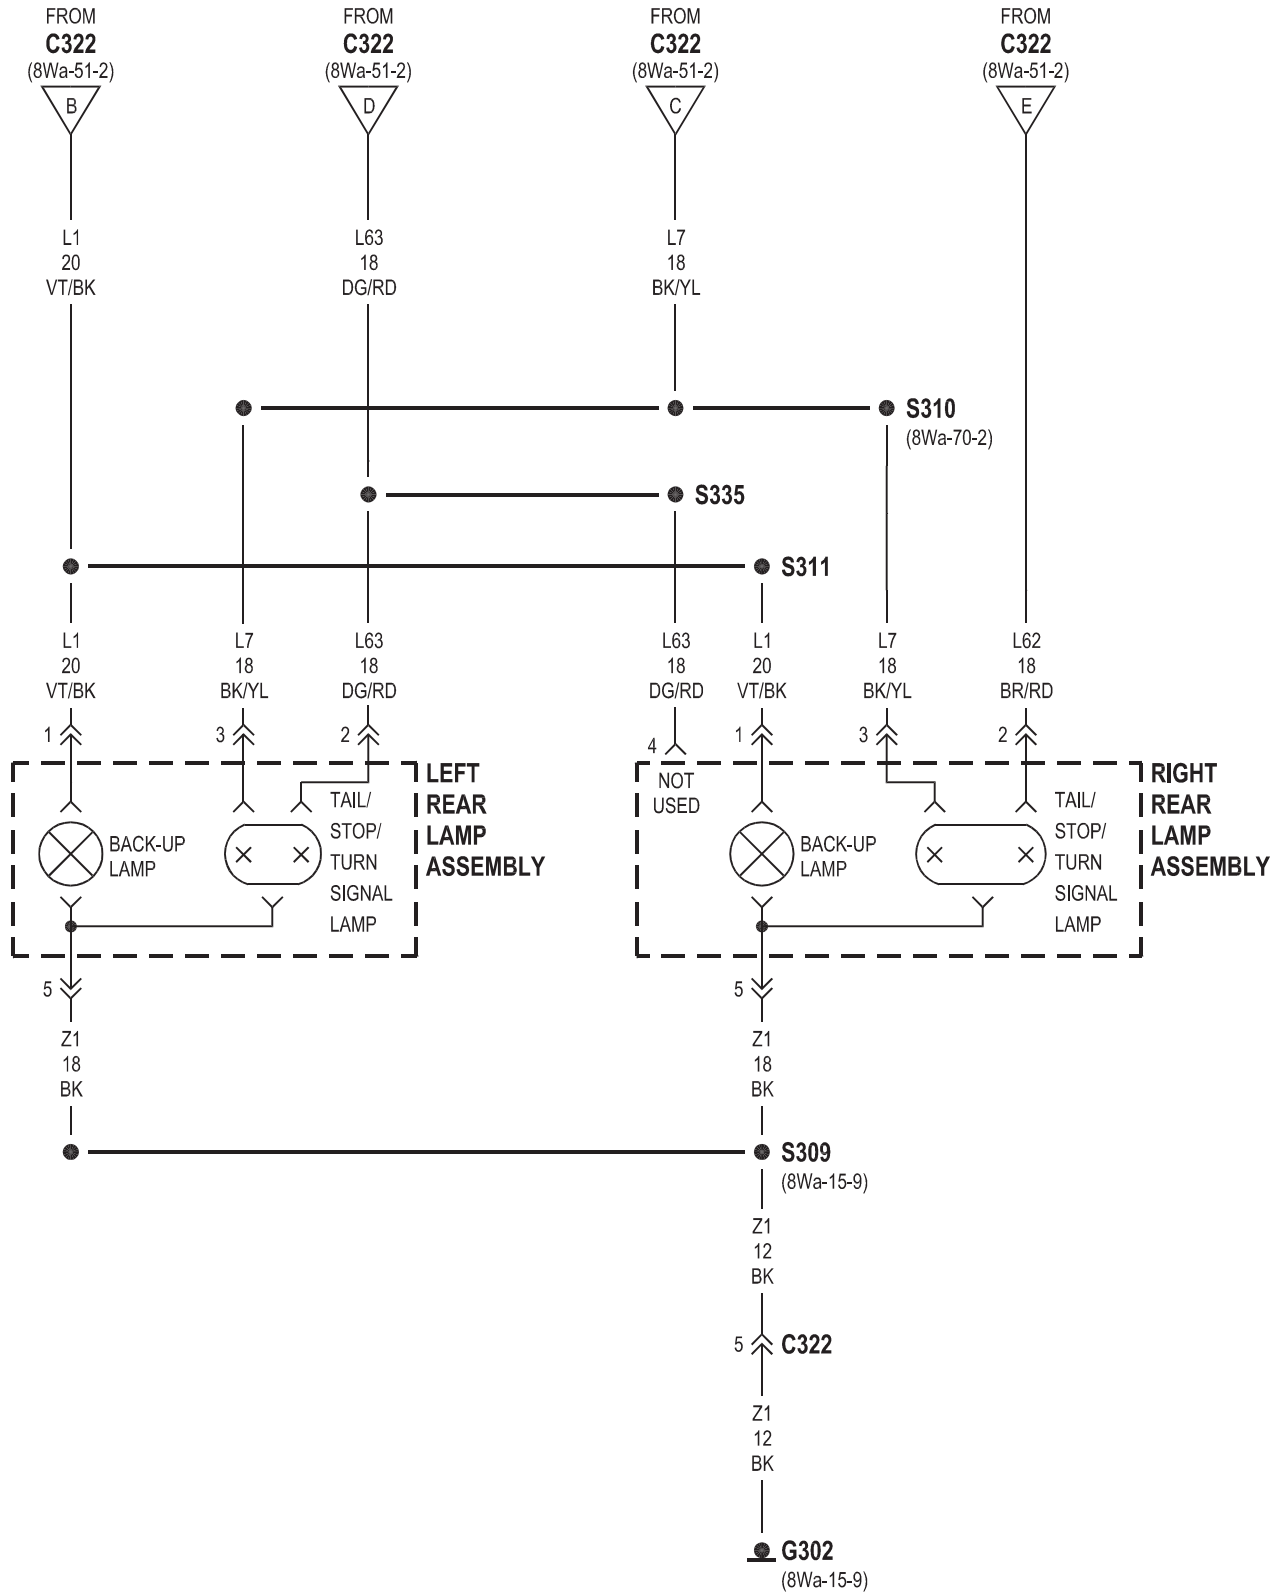

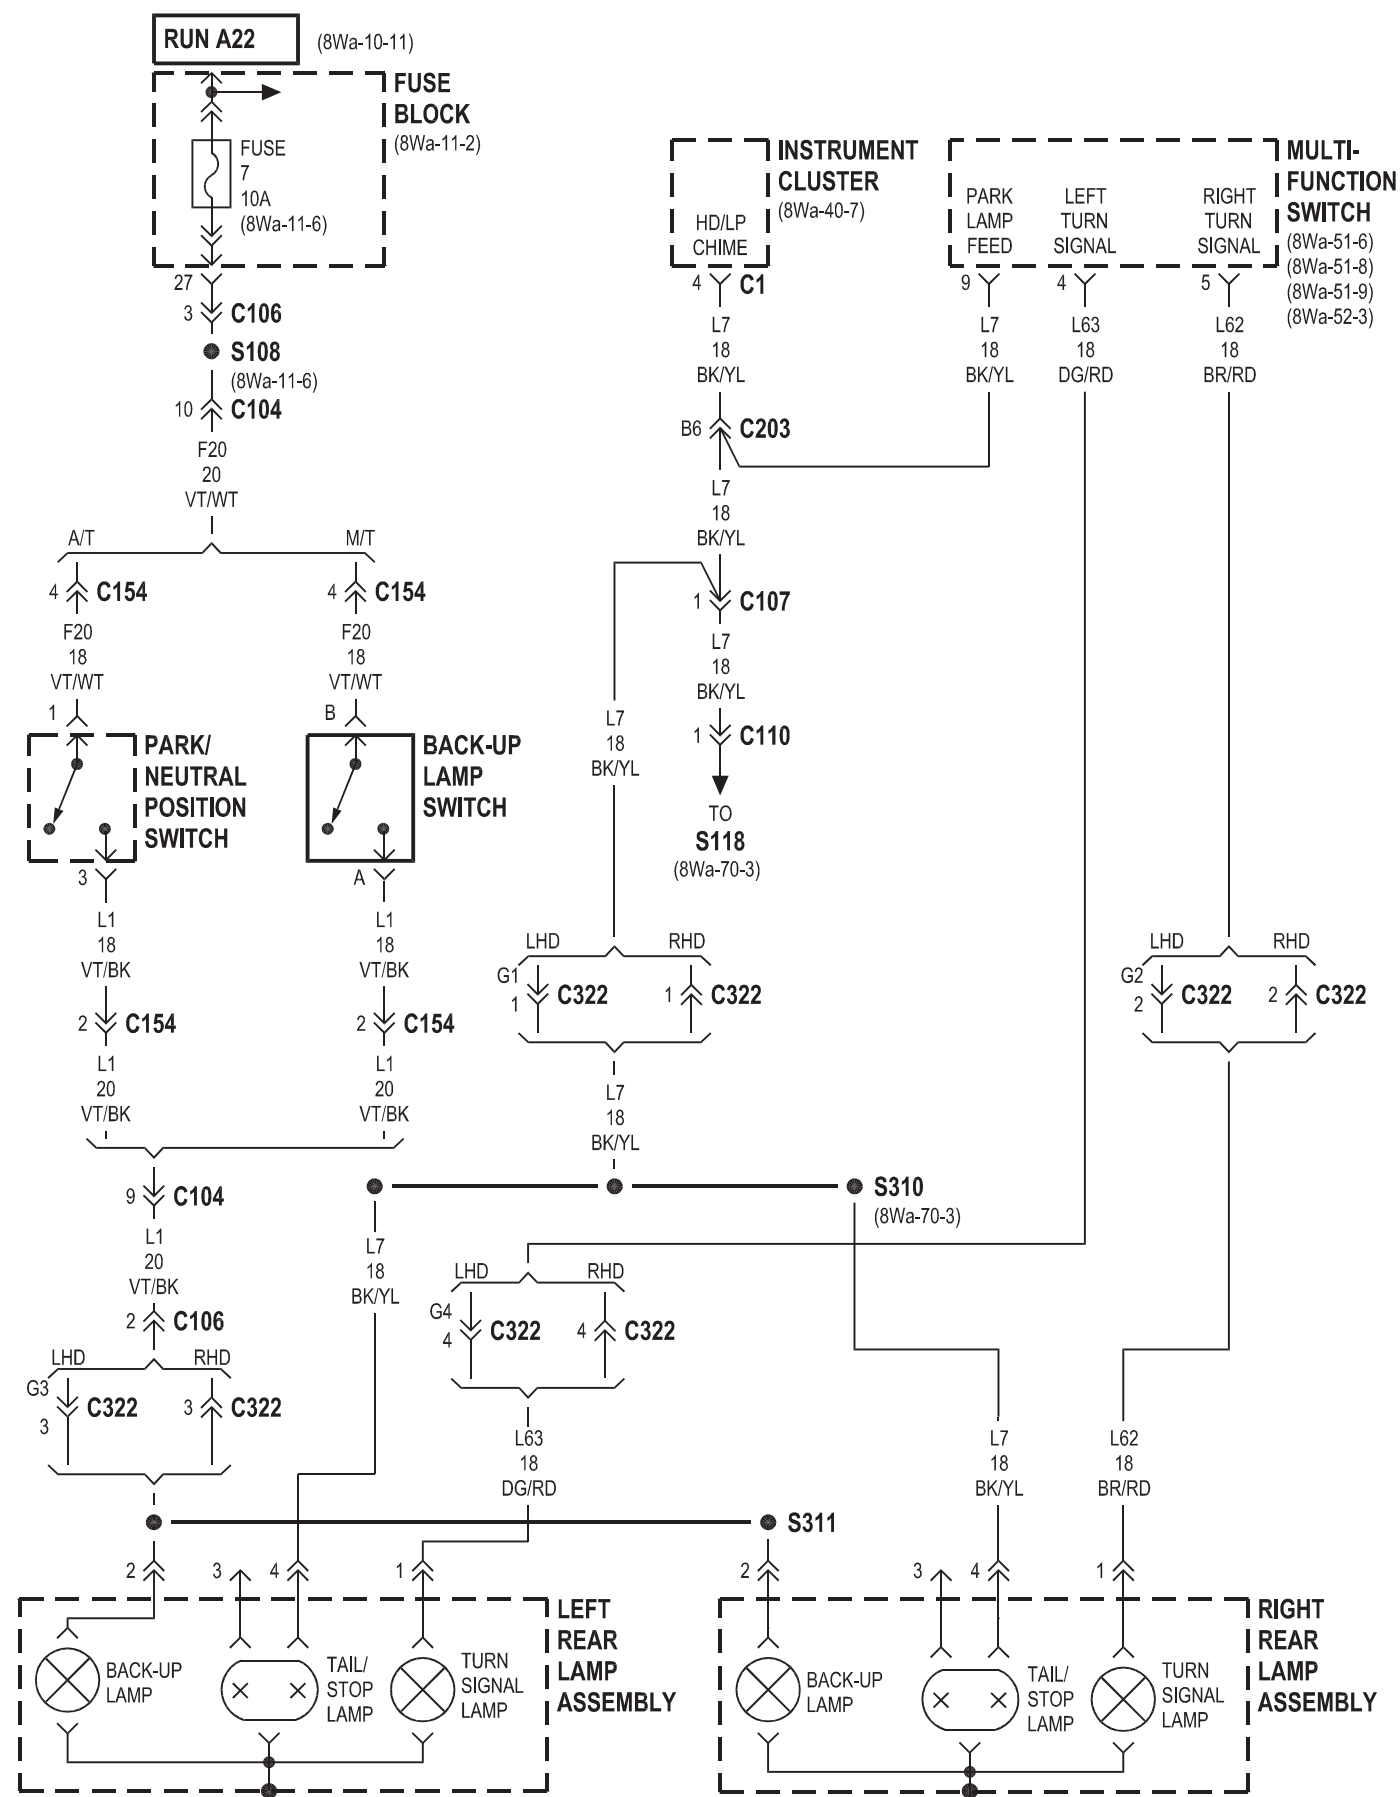

## 8W-51 REAR LIGHTING

<b>Component</b>	<b>Page</b>	<b>Component</b>	<b>Page</b>
Back-Up Lamp Switch . . . . .	8Wa-51-2, 4	Left License Lamp . . . . .	8Wa-51-8, 9
Brake Lamp Switch . . . . .	8Wa-51-5, 7	Left Rear Lamp Assembly . . . . .	8Wa-51-3, 4, 5, 6, 7
Brake Transmission Shift Interlock Solenoid . . . . .	8Wa-51-7	Multi- Function Switch . . . . .	8Wa-51-2, 4, 5, 6, 7, 8, 9
Center High Mounted Stop Lamp . . . . .	8Wa-51-5, 7	Park/Neutral Position Switch . . . . .	8Wa-51-2, 4
Controller Antilock Brake . . . . .	8Wa-51-5, 7	Powertrain Control Module . . . . .	8Wa-51-7

A/C COMPRESSOR CLUTCH - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	C3 20DB/BK	A/C COMPRESSOR CLUTCH RELAY OUTPUT
2	Z1 20BK	GROUND

A/C-HEATER CONTROL C1 - 5 WAY

CAV	CIRCUIT	FUNCTION
A	C7 12BR/TN	BLOWER MOTOR HIGH SPEED
B	C6 14LB	BLOWER MOTOR M2 SPEED
C	C5 16LG/LB	BLOWER MOTOR M1 SPEED
D	C4 18TN	BLOWER MOTOR LOW SPEED
E	C1 12DG	BLOWER MOTOR FEED

A/C-HEATER CONTROL C2 - 5 WAY

CAV	CIRCUIT	FUNCTION
1	F24 20RD/DG (RHD)	GROUND
1	Z11 20BK/WT (LHD)	GROUND
2	C36 20DB/RD	BLEND DOOR FEED BACK SIGNAL
3	F24 20RD/DG (LHD)	FUSED IGNITION SWITCH OUTPUT (RUN)
3	Z11 20BK/WT (RHD)	FUSED IGNITION SWITCH OUTPUT (RUN)
4	E2 20OR	FUSED PANEL LAMPS DIMMER SWITCH SIGNAL
5	Z1 20BK	GROUND

A/C-HEATER CONTROL C3 - 3 WAY

CAV	CIRCUIT	FUNCTION
A	C90 20LG	A/C SELECT INPUT
B	C1 12DG	BLOWER MOTOR FEED
C	Z1 12BK	GROUND

A/C HIGH PRESSURE SWITCH - 2 WAY

CAV	CIRCUIT	FUNCTION
1	C90 20LG	A/C HIGH PRESSURE SWITCH OUTPUT
2	C21 20DB/OR (4 CYL)	A/C HIGH PRESSURE SWITCH SENSE
2	C22 20DB/WT (6 CYL)	A/C SWITCH SENSE

A/C LOW PRESSURE SWITCH - 2 WAY		
CAV	CIRCUIT	FUNCTION
1	C22 20DB/WT (4 CYL)	A/C LOW PRESSURE SWITCH SENSE
1	C21 20DB/OR (4 CYL)	A/C SWITCH SENSE
2	C21 20DB/OR (6 CYL)	A/C SWITCH SENSE
2	C22 20DB/WT (6 CYL)	A/C LOW PRESSURE SWITCH SENSE

AIRBAG CONTROL MODULE - YELLOW 22 WAY		
CAV	CIRCUIT	FUNCTION
1	R45 18DG/LB	DRIVER AIRBAG LINE 2
2	R43 18BK/LB	DRIVER AIRBAG LINE 1
3	-	-
4	-	-
5	R42 18BK/YL	PASSENGER AIRBAG LINE 1
6	R44 18DG/YL	PASSENGER AIRBAG LINE 2
7	-	-
8	R166 18LG/BR (LHD)	PASSENGER AIRBAG INDICATOR DRIVER
9	-	-
10	Z6 18BK/PK	GROUND
11	R65 18LG/OR	PASSENGER AIRBAG MUX SWITCH SENSE
12	-	-
13	-	-
14	-	-
15	-	-
16	-	-
17	F14 18LG/YL	FUSED IGNITION SWITCH OUTPUT (RUN-START)
18	D25 18VT/YL	PCI BUS
19	-	-
20	F23 18DB/YL	FUSED IGNITION SWITCH OUTPUT (RUN)
21	-	-
22	R66 18LG/DG (LHD)	PASSENGER AIRBAG MUX SWITCH RETURN

BACK-UP LAMP SWITCH (M/T) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
A	L1 18VT/BK	BACK-UP LAMP FEED
B	F20 18VT/WT	FUSED IGNITION SWITCH OUTPUT (RUN)

BATTERY TEMPERATURE SENSOR - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	K118 18PK/YL	BATTERY TEMPERATURE SENSOR SIGNAL
2	K167 20BK/LB	SENSOR GROUND

BLEND DOOR ACTUATOR - 6 WAY

CAV	CIRCUIT	FUNCTION
5	-	-
6	-	-
7	Z11 20DB/WT	GROUND
8	C36 20YL	BLEND DOOR FEED BACK SIGNAL
9	-	-
10	F24 200R	FUSED IGNITION SWITCH OUTPUT (RUN)

BLOWER MOTOR - 2 WAY

CAV	CIRCUIT	FUNCTION
A	C1 12DG	BLOWER MOTOR RELAY OUTPUT
B	C7 12BK/TN	BLOWER MOTOR HIGH DRIVER

BLOWER MOTOR RELAY - BLACK 5 WAY

CAV	CIRCUIT	FUNCTION
1	C1 12DG	BLOWER MOTOR RELAY OUTPUT
2	Z1 20BK	GROUND
3	-	-
4	A111 12RD/LG	FUSED B(+)
5	F24 20DB/WT	FUSED IGNITION SWITCH OUTPUT (RUN)

BLOWER MOTOR RESISTOR BLOCK - 4 WAY

CAV	CIRCUIT	FUNCTION
1	C4 14TN	BLOWER MOTOR LOW DRIVER
2	C5 14LG	BLOWER MOTOR M1 DRIVER
3	C6 14LB	BLOWER MOTOR M2 DRIVER
4	C7 12BK/TN	BLOWER MOTOR HIGH DRIVER

BRAKE LAMP SWITCH - GRAY 6 WAY

CAV	CIRCUIT	FUNCTION
1	K29 20WT/PK	BRAKE LAMP SWITCH SENSE
2	Z1 20 BK (SUBWOOFER	GROUND
2	Z1 20BK	GROUND
3	V32 20YL/RD	SPEED CONTROL ON/OFF SWITCH SENSE
4	V30 20DB/RD	SPEED CONTROL BRAKE LAMP SWITCH OUTPUT

BRAKE LAMP SWITCH - GRAY 6 WAY

CAV	CIRCUIT	FUNCTION
5	F32 19PK/DB	FUSED B(+)
6	L50 18WT/TN	BRAKE LAMP SWITCH OUTPUT

BRAKE TRANSMISSION SHIFT INTERLOCK SOLENOID - WHITE 2 WAY

CAV	CIRCUIT	FUNCTION
1	K29 20WT/PK	BRAKE LAMP SWITCH SENSE
2	G5 20DB/WT	FUSED IGNITION SWITCH OUTPUT (RUN-START)

BRAKE WARNING INDICATOR SWITCH - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	G9 20GY/BK	BRAKE WARNING INDICATOR DRIVER
2	G99 20GY/WT	BRAKE WARNING INDICATOR DRIVER

FUEL INJECTOR NO. 3 (2.5L) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	F42 18DG/LG	FUSED AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K13 18YL/WT	FUEL INJECTOR NO. 3 DRIVER

FUEL INJECTOR NO. 3  
(4.0L)

FUEL INJECTOR NO. 3 (4.0L) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	F42 18DG/LG	FUSED AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K13 18YL/WT	FUEL INJECTOR NO. 3 DRIVER

FUEL INJECTOR NO. 4  
(2.5L)

FUEL INJECTOR NO. 4 (2.5L) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	F42 18DG/LG	FUSED AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K14 18LB/BR	FUEL INJECTOR NO. 4 DRIVER

FUEL INJECTOR NO. 4  
(4.0L)

FUEL INJECTOR NO. 4 (4.0L) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	F42 18DG/LG	FUSED AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K14 18LB/BR	FUEL INJECTOR NO. 4 DRIVER

FUEL INJECTOR NO. 5  
(4.0L)

FUEL INJECTOR NO. 5 (4.0L) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	F42 18DG/LG	FUSED AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K15 18PK/BK	FUEL INJECTOR NO. 5 DRIVER

FUEL INJECTOR NO. 6  
(4.0L)

FUEL INJECTOR NO. 6 (4.0L) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	F42 18DG/LG	FUSED AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K16 18LG/BK	FUEL INJECTOR NO. 6 DRIVER

FUEL PUMP  
MODULE

FUEL PUMP MODULE - BLACK 6 WAY

CAV	CIRCUIT	FUNCTION
1	A141 18DG/WT	FUEL PUMP RELAY OUTPUT
2	-	-
3	K226 20DB/LG	FUEL LEVEL SENSOR SIGNAL
4	K4 20BK/LB	SENSOR GROUND
5	-	-

## 8W-90 CONNECTOR/GROUND LOCATIONS

## TABLE OF CONTENTS

page

**CONNECTOR/GROUND LOCATIONS**

DESCRIPTION . . . . . 1

**CONNECTOR/GROUND  
LOCATIONS****DESCRIPTION**

This section provides illustrations identifying connector and ground locations in the vehicle. A connector and ground index is provided. Use the wiring diagrams in each section for connector and ground identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

Connector Name/Number	Color	Location	Fig.
A/C Compressor Clutch	BK	At A/C Compressor Clutch	17
A/C Heater Control - C1		Center of Instrument Panel	10, 12
A/C Heater Control - C2		Center of Instrument Panel	10, 12
A/C Heater Control - C3		Center of Instrument Panel	10, 12
A/C High Pressure Switch		Left Side of Engine	17
A/C Low Pressure Switch		Near Powertrain Control Module	5
Airbag Control Module	YL	Front of Floor Pan Tunnel	8, 9
Back-up Lamp Switch (M/T)	BK	Right Side of Transmission	20, 21
Battery Temperature Sensor	BK	Under Battery Tray	3, 4
Blend Door Actuator		On HVAC Harness	N/S
Blower Motor		On HVAC Harness	N/S
Blower Motor Relay	BK	On HVAC Harness	N/S
Blower Motor Resistor Block		On HVAC Harness	N/S
Brake Lamp Switch	GY	Top of Brake Pedal Bracket	8, 9
Brake Transmission Shift Interlock Solenoid	WT	Near Steering Column	9
Brake Warning Indicator Switch	BK	On Brake Master Cylinder	N/S
C103	BK	Rear of Engine Compartment	3, 4, 5
C104 (LHD)	GY	Rear of Engine Compartment	3, 5
C104 (RHD)	BK	Rear of Engine Compartment	4, 5
C104 (RHD ABS)	GY	Rear of Engine Compartment	N/S
C106 (LHD)	BK	Left Kick Panel	8, 14
C106 (RHD)	BK	Right Kick Panel	9
C107 (LHD)	YL	Left Kick Panel	8, 14
C107 (RHD)	YL	Right Kick Panel	9
C108 (LHD)	BL	Left Kick Panel	8, 14
C108 (RHD)	BL	Right Kick Panel	9

## CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
C110	BK	Left Fender Side Shield	1, 3, 4
C154	BK	Top Right Side of Transmission	20, 21, 22, 23, 24
C170 (LHD)	LT GY	Left Kick Panel	10, 14
C170 (RHD)	LT GY	Right Kick Panel	12
C202 (LHD)	GY	Left Kick Panel	8, 10, 14
C202 (RHD)	GY	Right Kick Panel	9, 12
C203 (LHD)	GN	Left Kick Panel	8, 10, 14
C203 (RHD)	GN	Right Kick Panel	9, 12
C204 (LHD)	RD	Left Kick Panel	8, 10, 14
C204 (RHD)	RD	Right Kick Panel	9, 12
C205	LT GN	Left Kick Panel	11, 12
C322	BK	Left Kick Panel	8, 9, 13, 25
C323 (LHD)	RD	Left Kick Panel	8, 13, 25
C323 (RHD)	GY	Left Kick Panel	9
C325 (4 Spkr Sys)	WT	Left Side of Sound Bar	25
C326 (Hard Top)	BK	Left Rear Quarter Panel	25
C329 (LHD)	BK	Left Side of Rear Bumper	27
C329 (Built-up-Export)	BK	Left Rear of Rear Bumper	27
C330 (4 Spkr Sys)	WT	Left Side of Sound Bar	25
C331 (Hard Top)	BK	Left Rear Quarter Panel	25
Camshaft Position Sensor	GY	Right Side of Engine	16, 24
Cigar Lighter/Power Outlet	RD	Rear of Cigar Lighter	10, 12
Circuit Breaker	GY	Near Day Time Running Lamp Module	N/S
Clockspring - C1	NAT	Rear of Clockspring	15
Clockspring - C2	YL	Rear of Clockspring	15
Clutch Pedal Position Switch (M/T)	BK	Top of Clutch Pedal Bracket	8, 9, 13
Controller Anti-Lock Brake		Rear Left Side of Dash Panel	N/S
Crankshaft Position Sensor		At Rear of Intake Manifold	16, 18
Data Link Connector	BK	Bottom Driver Side of Instrument Panel	10, 12
Daytime Running Lamp Module (Except Built-Up-Export)	BK	Left Side of Engine Compartment	N/S
Driver Door Ajar Switch	NAT	At "A" Pillar	8, 9
Engine Coolant Temperature Sensor	BK	On Thermostat Housing	17
Engine Oil Pressure Sensor	BK	Right Side of Engine Block	16, 23
Evap/Purge Solenoid	BK	Left Fender Side Shield	1
Front Washer Pump	BK	Under Washer Fluid Reservoir	1
Front Wiper Motor	BK	At Motor	6
Fuel Injector NO.1	BK	At Injector	17, 18
Fuel Injector NO.2	BK	At Injector	17, 18
Fuel Injector NO.3	BK	At Injector	17, 18

## CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Fuel Injector NO.4	BK	At Injector	17, 18
Fuel Injector NO.5	BK	At Injector	17
Fuel Injector NO.6	BK	At Injector	17
Fuel Pump Module	BK	Above Fuel Tank	26
G100		Rear Center of Engine Compartment	3, 4
G101		Rear Center of Engine Compartment	3, 4
G102		Left Radiator Closure Panel	1
G103		Right Radiator Closure Panel	2
G104		Near Generator	N/S
G105		Right Rear of Engine Block	16, 23, 24
G106		Right Rear of Engine Block	N/S
G107		Right Rear of Engine Block	N/S
G200 (LHD)		Left Rear of Instrument Panel	10
G200 (RHD)		Right Rear of Instrument Panel	12
G201 (LHD)		Left Rear of Instrument Panel	10
G201 (RHD)		Right Rear of Instrument Panel	12
G202 (LHD)		Right Rear of Instrument Panel	11
G202 (RHD)		Left Rear of Instrument Panel	12
G203 (LHD)		Right Rear of Instrument Panel	11
G203 (RHD)		Left Rear of Instrument Panel	12
G300 (LHD)		Left Kick Panel	8
G300 (RHD)		Right Kick Panel	9
G301 (LHD)		Between Front Seats	8
G301 (RHD)		Left Kick Panel	9
G302 (LHD)		Left Kick Panel	8
G302 (RHD)		Right Kick Panel	9
G Switch	BK	Near T/O for Controller Anti-Lock Brake	N/S
Generator	BK	Rear of Generator	16
Headlamp Leveling Switch (Built-Up-Export)	WT	At Switch	10, 12
High Note Horn	BK	Left Front Fender Side Shield	1
Idle Air Control Motor	BK	Side of Throttle Body	17, 18
Ignition Coil (2.5L)	GY	Right Side of Engine	N/S
Ignition Coil Pack (4.0L)	BK	Right Rear of Engine	16
Ignition Switch		On Steering Column	15
Instrument Cluster - C1		Rear of Cluster	10, 12
Instrument Cluster - C2		Rear of Cluster	10, 12
Intake Air Temperature Sensor	GY	Rear of Intake Manifold	17, 18
Leak Detection Pump (Except Built-Up-Export)	BK	Engine Compartment Left Side	7
Left Courtesy Lamp	BK	Left Side of Instrument Panel	10, 12

## CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Left Fog Lamp (Except Built-Up-Export)	BK	At Lamp	N/S
Left Front Park/Turn Signal Lamp (Except Built-Up-Export)	BK	At Lamp	N/S
Left Front Position Lamp (Built-Up-Export)	BK	At Lamp	1
Left Front Speaker	BK	At Speaker	10, 12
Left Front Turn Signal Lamp (Built-Up-Export)	BK	At Lamp	N/S
Left Front Wheel Speed Sensor		Left Side of Engine Compartment Near Hydraulic Control Unit	N/S
Left Headlamp	BK	Rear of Lamp	1
Left Headlamp Leveling Motor (Built-Up-Export)	BK	Near Headlamp at Motor	1
Left License Lamp (Built-Up-Export)	GY	At Lamp	27
Left Rear Lamp Assembly(Built-Up-Export)	BK	At Lamp	27
Left Rear Lamp Assembly(Except Built-Up-Export)	BK	At Lamp	27
Left Rear Speaker (Sound Bar)	BK	At Sound Bar	N/S
Left Rear Wheel Speed Sensor		Near Vehicle Speed Sensor T/O	26
Left Side Repeater Lamp (Built-Up-Export)	GY	At Lamp	N/S
Low Note Horn (Except Built-Up-Export)	BK	Left Front Fender Side Shield	1
Manifold Absolute Pressure Sensor	BK	Side of Throttle Body	17, 18
Multi-Function Switch	GY	Steering Column	15
Oxygen Sensor 1/1 Upstream		On Front Exhaust Pipe	17
Oxygen Sensor 1/2 Downstream	BK	Rear of Catalytic Converter	17, 19
Oxygen Sensor 2/1 Upstream (California/European III)		Near Idle Air Control Motor T/O	16, 18
Oxygen Sensor 2/2 Downstream (4.0L California/European III)	GY	T/O near Ignition Coil Pack T/O	24
Park/Neutral Position Switch (A/T)		Left Side of Transmission	22
Passenger Airbag	YL	Rear of Airbag	8, 9
Passenger Airbag On/Off Switch		Lower Center of Instrument Panel	8
Passenger Door Ajar Switch	BK	Near Top Hinge of Passenger Door	8, 9

## CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Power Steering Pressure Switch (2.5L)	BK	Near Power Steering Pump	18
Powertrain Control Module - C1 (LHD)	BK	Right Rear of Engine Compartment	5
Powertrain Control Module - C1 (RHD)	BK	Left Rear of Engine Compartment	
Powertrain Control Module - C2 (LHD)	WT	Right Rear of Engine Compartment	5
Powertrain Control Module - C2 (RHD)	WT	Left Rear of Engine Compartment	N/S
Powertrain Control Module - C3 (LHD)	GY	Right Rear of Engine Compartment	3
Powertrain Control Module - C3 (RHD)	GY	Left Rear of Engine Compartment	4
Radio - C1	GY	Rear of Radio	10, 12
Radio - C2	BK	Rear of Radio	10, 12
Radio Choke and Relay	BK	Center Lower Instrument Panel	N/S
Rear Fog Lamp (Built-Up-Export)	BK	At Lamp	27
Rear Washer Pump (Hard Top)	BK	Under Washer Fluid Reservoir	1
Rear Window Defogger Switch (Hard Top)	GY	Behind Rear Window Defogger Switch	10, 12
Rear Wiper Motor (Hard Top)	BK	At Rear Wiper Motor	N/S
Rear Wiper/Washer Switch (Hard Top)	WT	Behind Rear Wiper/Washer Switch	10, 12
Right Courtesy Lamp	BK	Right Side of Instrument Panel	11, 12
Right Fog Lamp (Except Built-Up-Export)	BK	At Lamp	2
Right Front Park/Turn Signal Lamp (Except Built-Up-Export)	BK	At Lamp	2
Right Front Position Lamp (Built-Up- Export)	BK	At Lamp	2
Right Front Speaker	BK	At Speaker	11, 12
Right Front Turn Signal Lamp (Built-Up-Export)	BK	At Lamp	2
Right Front Wheel Speed Sensor	BK	Rear of Engine	N/S
Right Headlamp	BK	Rear of Lamp	2
Right Headlamp Leveling Motor (Built-Up-Export)	BK	Near Headlamp at Motor	2
Right License Lamp	GY	At Lamp	27
Right Rear Lamp Assembly	BK	At Lamp	27
Right Rear Speaker (Sound Bar)	BK	At Sound Bar	N/S

## CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Right Rear Wheel Speed Sensor	BK	Near Vehicle Speed Sensor T/O	26
Right Side Marker Lamp (Except Built-Up-Export)	GY	At Lamp	N/S
Right Side Repeater Lamp	GY	At Lamp	2
Seat Belt Switch	BK	Near Park Brake Switch	25
Sentry Key Immobilizer Module	BK	At Immobilizer	9, 15
Sound Bar Dome Lamp	BK	At Sound Bar	N/S
Speed Control Servo	BK	Left Side Engine Compartment	7
Subwoofer	LTGY	Floor Pan	8, 9
Throttle Position Sensor	WT	Side of Throttle Body	17, 18, 24
Torque Converter Clutch Solenoid	BK	Left Side of Transmission	N/S
Transfer Case Switch	BK	Left Side of Transfer Case	19
Transmission Range Indicator Illumination (PRNDL)	BK	Between Seats	8, 9
Underhood Lamp	BK	Under Hood	3
Vehicle Speed Sensor	BK	Left Rear of Transfer Case	19
Windshield Wiper Switch	NAT	At Steering Column	N/S

## 8W-95 SPLICE LOCATIONS

## TABLE OF CONTENTS

page

**SPLICE LOCATIONS**

DESCRIPTION . . . . . 1

**SPLICE LOCATIONS****DESCRIPTION**

This section provides illustrations identifying the general location of the splices in this vehicle. A splice

index is provided. Use the wiring diagrams in each section for splice number identification. Refer to the index for proper splice number. For splices that are not shown in the figures N/S appears in the Fig. column.

Splice Number	Location	Fig.
S101	Near T/O for Power Distribution Center	3, 4
S102	Near T/O for G100 or Daytime Running Lamp Module	3, 4
S103	Near T/O for G101	3, 4
S105	Near T/O for Daytime Running Lamp Module	N/S
S106	Near T/O for G100	3, 4
S108	Near T/O for Power Distribution Center	3, 4
S111	Near T/O for Battery Temperature Sensor or Power Distribution Center	3, 4
S113	Near T/O for G100	3, 4
S115 (Except Built-Up-Export)	Near T/O for Evap/Purge Solenoid	1
S116 (Except Built-Up-Export)	Near T/O for High Note Horn	1
S117	Near T/O for High Note Horn	1
S118	Near Left Headlamp T/O	1
S121	Near T/O for Powertrain Control Module - C2	6
S122	Near Grommet for Left Front Turn Signal Lamp	N/S
S123	Near T/O for G105	5, 9, 11
S124	Near T/O for G105	5, 11
S125 (Built-Up-Export)	Near Grommet for Right Front Turn Signal Lamp	1
S126	Near T/O for C104	5, 6, 11
S127	Near T/O for Idle Air Control Motor	7, 10
S128	Between Fuel Injector NO. 2 and Fuel Injector NO. 3	7, 10
S129	Near T/O for C104	5, 6, 11
S130	Near T/O for C104	5, 6, 11
S132	Near T/O for C154	8, 9, 11
S133	Near T/O for C154	8, 9, 11
S134	Near T/O for C154	6, 11
S135	Near T/O for Oxygen Sensor 1/2 Downstream	6, 11
S136	In Battery Harness Near PDC	N/S

## SPLICE LOCATIONS (Continued)

Splice Number	Location	Fig.
S137	Near T/O for Throttle Position Sensor	7
S138	Middle of Radiator Closure Panel	2
S140	Near T/O for C104	N/S
S141	Near T/O for Left Front Turn Signal Lamp	N/S
S142	Near T/O for Right Front Turn Signal Lamp	1
S143	Near T/O for Left Front Park/Turn Signal Lamp	N/S
S144	Near T/O for Right Front Park/Turn Signal Lamp	1
S147	Between T/O's for Underhood Lamp and C103, C104	3, 4
S150	Right Headlamp T/O	2
S151	Left Headlamp T/O	2
S152	Near Left Headlamp T/O	N/S
S153	Near T/O for Camshaft Position Sensor	8
S155 (Day Time Running Lamps)	Near T/O for Day Time Running Lamp Module	3
S156	Near T/O for ABS Pump Motor	3
S202 (LHD)	Center of Instrument Panel	12
S202 (RHD)	Center Rear of Instrument Panel	13
S204	Center Rear of Instrument Panel	12, 13
S206	Center Rear of Instrument Panel	12, 13
S207	Near Cigar Lighter T/O	12, 13
S208	Near Blower Motor	N/S
S209	Near T/O for C202, C203, and C204	12, 13
S301 (LHD)	Center Rear of Dash Panel	14
S301 (RHD)	Near T/O for Sentry Key Immobilizer	15
S304 (LHD)	Center Rear of Dash Panel	14
S304 (RHD)	Near T/O for C202, C203, C204, C106, C107, and C108	15
S309	Front of Left Door Opening	16
S310	Left Rear Quarter Panel, Near Body Grommet	16
S311	Near Left Rear Lamp Assembly Connector	17
S313	Front of Left Rear Wheel Well	16
S314	Top of Left Rear Wheel Well	16
S315	Back of Right Rear Wheel Well	17
S316	In T/O for Rear Fog Lamp	17
S317	Near T/O for Left License Lamp	17
S320 (LHD)	Near T/O for 100 way Connector	14
S320 (RHD)	Near T/O for Fuse Block	15
S331 (LHD)	Near T/O for 100 way Connector	14
S331 (RHD)	Near T/O for Fuse Block	15
S332	Near T/O for Airbag Control Module	14
S333 (LHD)	Near T/O for 100 way Connector	14

Fuel Tank Mounting Strap Bolts	Refer to service manual text.	-	-
Fuel Pump Module Locknut	74	55	-
Fuel Tank Skidplate Bolts	16	-	141

## ROLLOVER VALVE

### DESCRIPTION

The fuel tank is equipped with 2 rollover valves. The valves are located on the top of the fuel tank (Fig. 1) .

80a43851

**Fig. 1 Rollover Valve Location**

- 1 - FUEL PUMP MODULE
- 2 - FUEL SUPPLY TUBE

- 4 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 5 - LOCKNUT
- 6 - ROLLOVER VALVE
- 7 - TOP OF FUEL TANK
- 8 - ELECTRICAL CONNECTOR
- 9 - ROLLOVER VALVE

### OPERATION

The rollover valves will prevent fuel flow through the fuel tank vent (EVAP) hoses in the event of an accidental vehicle rollover. The EVAP canister draws fuel vapors from the fuel tank through these valves.

The valves are not serviceable. If replacement is necessary, the fuel tank must be replaced.

## CRANKSHAFT POSITION SENSOR

### REMOVAL

The crankshaft position (CKP) sensor is mounted to the transmission bellhousing at the left/rear side of the engine block.

The sensor may be mounted to the transmission with one of the following three different configurations:

- with one bolt (Fig. 1). If sensor is equipped with one mounting bolt, **it is adjustable..**
- with two nuts (Fig. 2).
- with two bolts (Fig. 3).

80be45c4

**Fig. 1 Crankshaft Position Sensor—One-Bolt Mounting**

- 1 - SENSOR PIGTAIL
- 2 - CRANKSHAFT POSITION SENSOR
- 3 - MOUNTING BOLT
- 4 - TRANSMISSION HOUSING
- 5 - PAPER SPACER
- 6 - SLOTTED HOLE

(1) Near right-rear side of engine, disconnect sensor pigtail harness (electrical connector) from main electrical harness.

(2) Depending upon application, remove either sensor mounting bolt(s) or nuts.

(3) Remove sensor from engine.

### INSTALLATION

#### Sensor With 2-Bolt Mounting:

(1) Install sensor flush against opening in transmission housing.

(2) Install and tighten two sensor mounting bolts to 12 N·m (9 ft. lbs.) torque. The two sensor mounting bolts are specially machined to correctly space

80be45c5

**Fig. 2 Crankshaft Position Sensor—Two-Nut Mounting**

unit to flywheel. Do not attempt to install any other bolts.

#### Sensor With 2-Nut Mounting:

(3) Install and tighten two sensor mounting nuts to 12 N·m (9 ft. lbs.) torque.

#### Sensor With One-Bolt Mounting:

New replacement sensors will be equipped with a paper spacer glued to bottom of sensor. If installing (returning) a **used** sensor to vehicle, a new paper spacer must be installed to bottom of sensor. This spacer will be ground off the first time engine is started. If spacer is not used, sensor will be broken the first time engine is started.

(4) New Sensors: Be sure paper spacer is installed to bottom of sensor. If not, obtain spacer PN05252229.

(5) Used Sensors: Clean bottom of sensor and install spacer PN05252229.

(6) Install sensor into transmission bellhousing hole.

(7) Push sensor against flywheel/drive plate. With sensor pushed against flywheel/drive plate, tighten mounting bolt to 7 N·m (60 in. lbs.) torque.

(8) Connect sensor pigtail harness electrical connector to main wiring harness.

## FUEL INJECTOR

## DESCRIPTION

An individual fuel injector (Fig. 4) is used for each individual cylinder.

80b6f035

**Fig. 4 Fuel Injector—Typical**

- 1 - FUEL INJECTOR
- 2 - NOZZLE
- 3 - TOP (FUEL ENTRY)

## OPERATION - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

## OPERATION - FUEL INJECTOR

The top (fuel entry) end of the injector (Fig. 4) is attached into an opening on the fuel rail.

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the powertrain control module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

## O2 HEATER RELAY

### DESCRIPTION

The oxygen (O2) sensor heater relay is located in the Powertrain Distribution Center (PDC).

### OPERATION

Refer to Oxygen Sensor for oxygen sensor relay information.

### REMOVAL

The oxygen sensor heater relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

### INSTALLATION

The oxygen sensor heater relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

- (1) Install relay to PDC.
- (2) Install cover to PDC.

## O2 SENSOR

### DESCRIPTION

The Oxygen Sensors (O2S) are attached to, and protrude into the vehicle exhaust system. Four different sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2).

### OPERATION

An O2 sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7-to-1 air/fuel ratio necessary for proper engine operation and to control emissions.

The O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the wire harness. This is why it is important to never solder an O2 sensor connector, or pack the connector with grease.

Four wires (circuits) are used on each O2 sensor: a 12-volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

**Oxygen Sensor Heater Relay:** If the vehicle is equipped with 4 oxygen sensors, a separate oxygen sensor relay is used to supply voltage to the sensor heating elements. This particular relay is used only for the 1/2 and 2/2 downstream sensors. Voltage for the other 2 sensor heating elements is supplied directly from the ASD relay. Refer to 8, Wiring Diagrams to determine which relay is used.

To avoid the large simultaneous current surge needed to operate all 4 sensors, power is delayed to the 2 downstream heater elements by the PCM for approximately 2 seconds.

#### **Oxygen Sensor Heater Elements:**

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures around 70°F, the resistance of the heating element is approximately 4.5 ohms. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

**Upstream Sensor - Engine Equipped With 2 Sensors:** The upstream sensor (1/1) provides an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensor. The PCM will change the air/fuel ratio until the upstream sensor inputs a voltage that the PCM has determined will make the downstream sensor output (oxygen content) correct.

The upstream oxygen sensor also provides an input to determine catalytic convertor efficiency.

## O2 SENSOR (Continued)

**Downstream Sensor - Engine Equipped With 2 Sensors:** The downstream oxygen sensor (1/2) is also used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensor also provides an input to determine catalytic convertor efficiency.

**Upstream Sensors - Engine Equipped With 4 Sensors:** Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic

convertor efficiency is not calculated with this package.

**Downstream Sensors - Engine Equipped With 4 Sensors:** Two downstream sensors are used (1/2 and 2/2). The downstream sensors are used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage, and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Engines equipped with either a downstream sensor(s), or a post-catalytic sensor, will monitor catalytic convertor efficiency. If efficiency is below emission standards, the Malfunction Indicator Lamp (MIL) will be illuminated and a Diagnostic Trouble Code (DTC) will be set. Refer to Monitored Systems in Emission Control Systems for additional information.

- 2 - COUNTER FIFTH GEAR

## MANUAL-AX5 (Continued)

(7) Remove fifth gear thrust ring from countershaft (Fig. 24).

**Fig. 24 Fifth Gear Thrust Ring**

- 1 - LOCK BALL NOTCH
- 2 - FIFTH GEAR THRUST RING

(8) Remove fifth gear thrust ring lock ball from countershaft (Fig. 25).

**CAUTION:** Lock balls, check balls, interlock balls, and interlock pins are used in various places in the transmission. Pins or balls must be identified and marked for installation reference.

**Fig. 25 Fifth Gear Thrust Ring Lock**

- 1 - PENCIL MAGNET
- 2 - CLUSTER GEAR
- 3 - LOCK BALL RECESS
- 4 - THRUST RING LOCK BALL

(9) Remove bolt holding reverse idler gear shaft lock plate to the intermediate plate.

(10) Remove reverse idler gear shaft and reverse idler gear assembly (Fig. 26).

**NOTE:** Retrieve pin and compression spring from the reverse idler shaft.

**Fig. 26 Reverse Idler Shaft**

- 1 - REVERSE IDLER SHAFT

(11) Remove output shaft rear bearing retainer bolts and remove retainer (Fig. 27).

**Fig. 27 Output Shaft Rear Bearing Retainer**

- 1 - BEARING RETAINER

## MANUAL-AX5 (Continued)

(12) Remove bolts holding 1-2 and 3-4 shift forks to the shift rails (Fig. 28) and discard bolts.

**Fig. 28 Shift Fork Bolts**

- 1 - 1-2 SHIFT FORK  
2 - 3-4 SHIFT FORK

(13) Remove bolts holding reverse shift arm bracket to intermediate plate (Fig. 29).

**Fig. 29 Reverse Shift Arm Bracket Bolts**

- 1 - BRACKET BOLTS

(14) Remove snap-ring holding output shaft rear bearing into the intermediate plate (Fig. 30).

(15) Remove countershaft rear bearing snap-ring.

**Fig. 30 Output Shaft Rear Bearing Snap-ring**

- 1 - OUTPUT SHAFT BEARING SNAP-RING  
2 - COUNTERSHAFT BEARING SNAP-RING

(16) With an assistant, support the mainshaft and countershaft. Tap on the rear of the mainshaft and countershaft with a plastic mallet. This will release the countershaft from the countershaft rear bearing and mainshaft rear bearing from the intermediate plate. The countershaft will release from the countershaft bearing first and can be removed by moving the countershaft rearward and downward (Fig. 31).

**Fig. 31 Countershaft and Rear Bearing**

- 1 - INPUT SHAFT  
2 - INTERMEDIATE PLATE  
3 - OUTPUT SHAFT  
4 - COUNTERSHAFT  
5 - COUNTERSHAFT REAR BEARING

(17) Remove the mainshaft forward until the mainshaft rear bearing is clear of the intermediate plate and then rotating the mainshaft downward out of the shift forks (Fig. 32).

## MANUAL-AX5 (Continued)

 8 - REVERSE SHIFT RAIL

**ASSEMBLY****GEARTRAIN AND SHIFT MECHANISM**

Refer to (Fig. 44) while assembling and installing the shift rail components.

**NOTE:** Shift rail components must be in neutral position when installing check balls and interlock pins. Check balls and interlock pins must be installed in original location.

(1) Install 3-4 shift rail into the intermediate plate.

## MANUAL-AX5 (Continued)

(2) Install 1-2 elongated check ball into the intermediate plate (Fig. 45).

**Fig. 45 1-2 Check Ball**

1 - 1-2 CHECK BALL  
2 - 3-4 SHIFT RAIL

(3) Install interlock pin into the 1-2 shift rail (Fig. 46).

(4) Install 1-2 shift rail into the intermediate plate.

**Fig. 46 1-2 Shift Rail Interlock Pin**

1 - INTERLOCK PIN  
2 - 1-2 SHIFT RAIL

(5) Install snap-ring onto 3-4 shift rail.

(6) Install reverse check ball into the intermediate plate (Fig. 47).

**Fig. 47 Reverse Check Ball**

1 - REVERSE CHECK BALL

(7) Install interlock pin into the reverse shift rail (Fig. 48).

**Fig. 48 Reverse Interlock Pin**

1 - REVERSE SHIFT RAIL  
2 - INTERLOCK PIN

## MANUAL-AX5 (Continued)

(8) Assemble reverse arm bracket to the reverse fork (Fig. 49).

**Fig. 49 Reverse Arm Bracket And Fork**

- 1 - REVERSE SHIFT FORK  
2 - REVERSE ARM BRACKET

(9) Install reverse shift rail into intermediate plate and position reverse arm bracket to intermediate plate (Fig. 50).

**Fig. 50 Reverse Shift Rail**

- 1 - REVERSE SHIFT RAIL AND FORK

(10) Install snap-ring onto reverse shift rail (Fig. 51).

**Fig. 51 Reverse Snap-ring**

- 1 - SNAP RING  
2 - REVERSE SHIFT RAIL

(11) Install reverse shift head and rail assembly into the intermediate plate.

(12) Install fifth gear interlock ball and check ball (Fig. 52).

**Fig. 52 Check Ball**

- 1 - FIFTH GEAR CHECK BALL

## MANUAL-AX5 (Continued)

(13) Install fifth gear shift rail (Fig. 53).

**Fig. 53 Fifth Gear Shift Rail**

- 1 - INTERMEDIATE PLATE  
2 - FIFTH GEAR SHIFT RAIL

(14) Remove intermediate plate from the vise, rotate plate 180° and reinstall plate in the vise using the same bolt and washer mounting set-up.

(15) Install shift rail detent balls in the intermediate plate.

(16) Install shift rail detent springs in the intermediate plate.

**NOTE:** Bottom detent spring is shorter than the others.

(17) Install shift rail detent plugs in the intermediate plate.

(18) Install 1-2 shift fork onto the 1-2 and 3-4 shift rails (Fig. 54).

**Fig. 54 1-2 Shift Fork**

- 1 - 1-2 SHIFT FORK  
2 - 3-4 SHIFT RAIL  
3 - 1-2 SHIFT RAIL

(19) Install snap-ring onto the 1-2 shift rail.

(20) Install 3-4 shift fork onto the 3-4 shift rail (Fig. 55).

**Fig. 55 3-4 SHIFT FORK**

- 1 - 3-4 SHIFT FORK  
2 - 3-4 SHIFT RAIL  
3 - 1-2 SHIFT RAIL  
4 - 1-2 SHIFT FORK

(21) Install mainshaft into intermediate plate. Guid output shaft through opening in intermediate plate until the shift forks are aligned with the appropriate synchronizer sleeves. The mainshaft rear bearing will be started in the intermediate plate but not fully driven in at this point.

(22) While an assistant supports the mainshaft, align rear of countershaft with inner race of countershaft rear bearing.

(23) Raise countershaft upward until gears mesh with the mating gears on the mainshaft.

(24) With a rubber mallet, tap on the input shaft and the front of the countershaft equally to install mainshaft rear bearing into intermediate plate and the rear of the countershaft into the rear countershaft bearing. It necessary hold countershaft into the intermediate plate and tap the countershaft rear bearing onto the countershaft and into the intermediate plate.

(25) Install snap-rings onto the rear mainshaft and countershaft bearings.

(26) Install bolts to hold the reverse shift arm bracket to the intermediate plate.

## MANUAL-AX5 (Continued)

(27) Install **new** bolts to hold the shift forks to the shift rails (Fig. 56).

**Fig. 56 Shift Fork Bolts**

- 1 - 1-2 SHIFT FORK  
2 - 3-4 SHIFT FORK

(28) Position mainshaft rear bearing retainer over the output shaft and onto the intermediate plate.

(29) Install **new** bearing retainer bolts into the intermediate plate.

(30) Move reverse shift arm into the reverse gear position. The reverse gear position is with the arm moved away from the intermediate plate (Fig. 57).

(31) Install reverse idler gear assembly into position on the mainshaft and reverse shift arm.

(32) Install compression spring and pin into the reverse idler gear shaft (Fig. 58).

(33) Install reverse idler shaft through the intermediate plate and reverse idler gear assembly (Fig. 59) until idler shaft pin contacts the gear assembly.

**NOTE:** The notched cut-out in the idler shaft goes toward the rear of the transmission.

**Fig. 57 Reverse Shift Arm Position**

- 1 - REVERSE SHIFT ARM  
2 - INTERMEDIATE PLATE

**Fig. 58 Compression Spring And Pin**

- 1 - REVERSE IDLER GEAR SHAFT  
2 - PIN  
3 - COMPRESSION SPRING

**Fig. 59 Reverse Idler Shaft**

- 1 - REVERSE IDLER SHAFT

## MANUAL-AX5 (Continued)

(34) Align pin with the alignment notch in the reverse idler gear assembly (Fig. 60). Alignment notch in the reverse idler gear race/hub is a small relief cut above one of the main longitudinal slots. Verify pin is aligned with proper slot, the opposite slot has an oil drain hole which the pin will drop into. The assembly will then be locked onto the shaft and will need to be disassembled in order to be removed.

(35) Depress compression spring and pin in reverse idler gear shaft (Fig. 61).

**Fig. 60 Align Idler Shaft Pin**

- 1 - REVERSE IDLER GEAR ASSEMBLY
- 2 - ALIGNMENT NOTCH

**Fig. 61 Depress Pin In Reverse Idler Gear Shaft**

- 1 - DEPRESS PIN

(36) Install reverse idler gear shaft the remainder of the way through the reverse idler gear assembly.

(37) Position reverse idler gear shaft lock plate onto the intermediate plate.

(38) Install a **new** bolt to hold the idler gear shaft lock plate to the intermediate plate.

(39) Install fifth gear thrust ring lock ball to the countershaft (Fig. 62).

(40) Install fifth gear thrust ring onto the countershaft and over the lock ball (Fig. 63).

**Fig. 62 Fifth Gear Thrust Ring Lock Ball**

- 1 - PENCIL MAGNET
- 2 - CLUSTER GEAR
- 3 - LOCK BALL RECESS
- 4 - THRUST RING LOCK BALL

**Fig. 63 Fifth Gear Thrust Ring**

- 1 - LOCK BALL NOTCH
- 2 - FIFTH GEAR THRUST RING

## MANUAL-AX5 (Continued)

(41) Install fifth gear shift fork to the countershaft fifth gear assembly.

(42) Install countershaft fifth gear bearings into the countershaft fifth gear assembly.

(43) Position countershaft fifth gear assembly on the countershaft. Verify fifth gear fork is installed onto the fifth gear shift rail.

(44) Install fifth gear synchro ring.

(45) Position fifth gear blocker ring onto the countershaft.

(46) With a mallet and spacer, tap fifth gear blocker ring onto the countershaft.

(47) Install **new** bolt to hold fifth gear shift fork to the fifth gear shift rail (Fig. 64).

**Fig. 64 Fifth Gear Retainer Bolt**

- 1 - SHIFT FORK RETAINER BOLT
- 2 - FIFTH GEAR SHIFT RAIL
- 3 - FIFTH GEAR SHIFT FORK

(48) Measure countershaft fifth gear thrust clearance.

(49) Select a snap-ring that will provide a thrust clearance of 0.10-0.30 mm (0.004-0.010 in.).

(50) Install snap-ring to hold fifth gear blocker ring onto countershaft.

(51) Remove intermediate plate from vise and remove bolts and washers from intermediate.

**EXTENSION AND ADAPTER HOUSING**

(1) Remove any residual sealer from transmission case, intermediate plate, and adapter/extension housing.

(2) Apply a 1/8 to 3/16 inch wide bead of Threebond® Liquid Gasket TB1281. Make sure to keep sealer bead to inside of bolt holes (Fig. 65).

J8921-1118

**Fig. 65 Transmission Gear Case Sealer**

- 1 - SEALER BEAD
- 2 - GEAR CASE

(3) Align geartrain and shift rails with mating holes in transmission case. Install transmission case to the intermediate plate (Fig. 66). Verify transmission case is seated on the intermediate plate locating pins.

J8921-1051

**Fig. 66 Transmission Gear Case And Intermediate Plate**

- 1 - GEAR CASE
- 2 - INTERMEDIATE PLATE

## MANUAL-AX5 (Continued)

- (4) Install **new** front bearing snap rings (Fig. 67).

**Fig. 67 Front Bearing**

1 - FRONT BEARING SNAP RINGS

- (5) Install front bearing retainer gasket to front bearing retainer.

- (6) Install front bearing retainer (Fig. 68) and tighten bolts to 17 N·m (12 ft. lbs.).

**Fig. 68 Front Bearing Retainer**

1 - FRONT BEARING RETAINER

- (7) On 4x2 transmissions, install speedometer drive gear locating snap-ring (Fig. 69). Install speedometer gear lock ball in output shaft and install speedometer gear onto output shaft. Install speedometer gear retaining snap-ring onto output shaft.

J8921-1119

**Fig. 69 Speedometer Drive Gear**

- 1 - SNAP RING  
2 - LOCK BALL  
3 - SNAP RING  
4 - OUTPUT SHAFT GROOVES  
5 - SPEEDOMETER GEAR

- (8) Apply a 1/8 to 3/16 inch wide bead of Threebond® Liquid Gasket TB1281 or equivalent, to sealing surface of adapter/extension housing. Keep sealer bead to inside of bolt holes.

- (9) Install adapter or extension housing on intermediate plate (Fig. 70). Tighten housing bolts to 34 N·m (25 ft. lbs.).

- (10) Position shift arm in shifter tower opening of adapter or extension housing (Fig. 71). Verify shifter arm is engaged into the shift rails.

J8921-1044

**Fig. 70 Adapter/Extension Housing—Typical**

- 1 - ADAPTER HOUSING  
2 - INTERMEDIATE PLATE

## MANUAL-AX5 (Continued)

**Fig. 71 Position Shift Arm**

1 - SHIFT ARM

(11) Start shifter arm shaft in hole in back of adapter or extension housing. Align shift arm and shifter arm shaft. Insert shifter arm shaft through the shifter arm and into forward portion of the adapter or extension housing (Fig. 72).

**Fig. 72 Shifter Arm Shaft**

1 - SHIFT ARM

2 - ADAPTER OR EXTENSION HOUSING

(12) Rotate shifter arm shaft until the hole in the shift arm is aligned with the hole in the shaft.

(13) Install shift arm retainer bolt and tighten to 38 N·m (28 ft. lbs.) (Fig. 73).

**Fig. 73 Shift Arm Retainer Bolt**

1 - RETAINER BOLT

2 - SHIFT ARM

(14) Install and tighten shifter arm shaft plug to 18 N·m (13 ft. lbs.) (Fig. 74).

**Fig. 74 Shifter Arm Shaft Plug**

1 - SHAFT PLUG

## MANUAL-AX5 (Continued)

(15) Install shift restrictor pins in shift tower and tighten to 27 N·m (20 ft. lbs.) (Fig. 75).

**CAUTION:** Restrictor pins are not interchangeable and are color coded. Verify pins are installed in the original locations.

**Fig. 75 Shifter Restrictor**

1 - RESTRICTOR PINS

(16) Install shift detent ball in detent opening of case (Fig. 76).

**Fig. 76 Detent Ball**

1 - PENCIL MAGNET  
2 - SHIFT DETENT BALL

(17) Install detent spring in case (Fig. 77).

80abfeee

**Fig. 77 Detent Spring**

1 - PENCIL MAGNET  
2 - DETENT BALL SPRING

(18) Install detent plug and tighten to 19 N·m (14 ft. lbs.) (Fig. 78).

80abfeef

**Fig. 78 Detent Ball Plug**

1 - TORX BIT  
2 - DETENT BALL PLUG

## MANUAL-AX5 (Continued)

- (19) Install shift tower gasket onto shift tower.  
(20) Install shift tower oil deflector and gasket onto the adapter or extension housing.  
(21) Install shift tower onto transmission case (Fig. 79).  
(22) Install shift tower bolts and tighten to 18 N·m (13 ft. lbs.).

J8921-1032

**Fig. 79 Shift Tower**

- 1 - SHIFT TOWER  
2 - ADAPTER/EXTENSION HOUSING

- (23) Install **new** metal o-ring onto the backup lamp switch.

- (24) Install backup lamp switch (Fig. 80) and tighten to 44 N·m (32.5 ft. lbs.).

J8921-100

**Fig. 80 Backup Lamp Switch**

- 1 - SHIFT TOWER  
2 - BACKUP LAMP SWITCH

- (25) Install **new** seal in adapter/extension housing.  
(26) Install vehicle speed sensor, if necessary.  
(27) Install clutch housing, release bearing, release fork and retainer clip.

## MANUAL-AX5 (Continued)

## MANUAL-AX5 (Continued)

## BEARING RETAINER

## REMOVAL

- (1) Remove release bearing and lever from the transmission.
- (2) Remove the bolts holding the front bearing retainer to the transmission case.
- (3) Remove the front bearing retainer from the transmission case.
- (4) With a pry tool, remove the front bearing retainer seal.

## INSTALLATION

- (1) Install new seal in the front bearing retainer with Tool Handle C-4171 and Installer 8211 (Fig. 81).
- (2) Remove any residual gasket material from the sealing surfaces of the bearing retainer and the transmission case.
- (3) Install new front bearing retainer gasket to the front bearing retainer.
- (4) Install the front bearing retainer onto the transmission case.
- (5) Install the bolts to hold the bearing retainer onto the transmission case.
- (6) Tighten the bolts to 17 N·m (12 ft. lbs.).
- (7) Install release bearing and lever onto the transmission.

Fig. 81 Front Bearing Retainer Seal

80b099ca

## INPUT SHAFT

## DISASSEMBLY

- (1) Verify that the 3-4 synchronizer is in the neutral position.
- (2) Separate input shaft from output shaft (Fig. 82). Note that the output shaft pilot bearing is an uncaged roller type bearing.

Fig. 82 Input and Output Shafts

J8921-1089

## INPUT SHAFT (Continued)

(3) Remove output shaft pilot bearing rollers from the input shaft and the output shaft.

(4) Remove fourth gear synchronizer ring from the input shaft (Fig. 83).

**Fig. 83 Input Shaft Components**

- 1 - BEARING
- 2 - SYNCHRO RING
- 3 - INPUT SHAFT
- 4 - BEARING SNAP RING

(5) Remove select fit snap-ring holding the input shaft bearing onto the input shaft.

(6) Remove bearing from the input shaft with Bearing Splitter P-334 and a shop press.

## ASSEMBLY

- (1) Position input shaft bearing onto input shaft.
- (2) Drive bearing onto input shaft with Driver L-4507.
- (3) Select the thickest snap-ring that will fit into the snap-ring groove of the input shaft (Fig. 84).
- (4) Lubricate output shaft pilot bearing bore of input shaft with petroleum jelly.

I.D. Mark	Snap Ring Thickness mm (in.)
0	2.05-2.10 (0.0807-0.0827)
1	2.10-2.15 (0.0827-0.0846)
2	2.15-2.20 (0.0846-0.0866)
3	2.20-2.25 (0.0866-0.0886)
4	2.25-2.30 (0.0886-0.0906)
5	2.30-2.35 (0.0906-0.0925)

J8921-50

**Fig. 84 Select Input Shaft Bearing Snap-ring**

## INPUT SHAFT (Continued)

(5) Install output shaft pilot bearing rollers in input shaft bore (Fig. 85). Ensure to use sufficient petroleum jelly to hold rollers in position.

J8921-64

**Fig. 85 Install Output Shaft Pilot Bearing Rollers**

- 1 - INPUT SHAFT  
2 - BEARING ROLLERS

(6) Install fourth gear synchronizer ring onto the input shaft.

(7) Install input shaft to output shaft. Use care when mating the two shafts not to displace any output shaft pilot bearing rollers.

## OUTPUT SHAFT

## DISASSEMBLY

(1) Remove input shaft and output shaft pilot bearing rollers from output shaft.

(2) Measure and note thrust clearance of output shaft gears (Fig. 86). Clearance should be 0.10-0.25 mm (0.004-0.010 in.).

(3) Remove output shaft fifth gear snap ring with two screwdrivers (Fig. 87).

(4) With Bearing Splitter P-334 or press plates positioned under first gear, press fifth gear, rear bearing, first gear and first gear bearing inner race off output shaft (Fig. 88).

(5) Remove first gear needle roller bearing from output shaft.

(6) Remove first gear bearing inner race lock ball with pencil magnet (Fig. 89).

(7) Remove first gear synchronizer ring.

J8921-36

**Fig. 86 Output Shaft Gear**

J8921-37

**Fig. 87 Fifth Gear Snap-ring**

- 1 - SNAP RING

(8) With Bearing Splitter P-334 or press plates positioned under second gear, press 1-2 synchronizer, reverse gear, and second gear from output shaft (Fig. 90).

(9) Remove second gear needle roller bearing from the output shaft or second gear.

(10) Remove select fit snap-ring holding the 3-4 synchronizer onto the output shaft (Fig. 91).

## OUTPUT SHAFT (Continued)

(11) With Bearing Splitter P-334 or press plates positioned under third gear, press the 3-4 synchronizer and third gear from output shaft (Fig. 92).

**Fig. 92 3-4 Synchronizer And Third Gear**

- 1 - 3-4 SYNCHRONIZER  
2 - THIRD GEAR

(12) Remove third gear needle roller bearing from output shaft or gear.

## ASSEMBLY

**NOTE:** Lubricate the transmission components with Mopar 75W-90 GL 3 gear lubricant during assembly. Use petroleum jelly to lubricate seal lips and/or hold parts in place during installation.

Refer to (Fig. 93) during assembly for AX5 gear assembly identification.

- (1) Lubricate transmission components with specified gear lubricant.
- (2) If necessary, assemble 1-2 and 3-4 synchronizer hubs, sleeves, springs and key inserts (Fig. 94).
- (3) Install third gear needle bearing onto the output shaft.
- (4) Install third gear over bearing and onto output shaft flange.
- (5) Install third gear synchronizer ring to third gear.
- (6) Position the 3-4 synchronizer onto the output shaft.
- (7) Using Adapter 6747-1A and a shop press, press the 3-4 synchronizer onto the output shaft.
- (8) Select the thickest snap-ring that will fit into the snap-ring groove of the output shaft (Fig. 95).

80be45fb

**Fig. 93 Geartrain Components**

8 - SPACER  
9 - COUNTER 5TH GEAR  
10 - SYNCHRO RING  
11 - 5TH SPLINE GEAR  
12 - SNAP RING

(9) Install snap-ring to hold 3-4 synchronizer onto output shaft.

(10) Verify third gear thrust clearance with feeler gauge (Fig. 96). Clearance should be 0.10 - 0.25 mm (0.004 - 0.010 in.). If clearance is out of specification, refer to Cleaning and Inspection.

(11) Install second gear needle bearing onto output shaft.

(12) Install second gear over bearing and onto output shaft flange.

(13) Install second gear synchronizer ring onto second gear.

(14) Position 1-2 synchronizer assembly onto splines of output shaft.

(15) With Driver MD-998805, Adapter 6747-1A and a shop press, press the 1-2 synchronizer onto the output shaft.

(16) Install first gear synchronizer ring into 1-2 synchronizer.

(17) Install first gear bearing inner race lock ball in output shaft (Fig. 97).

## OUTPUT SHAFT (Continued)

(18) Install first gear needle bearing onto output shaft (Fig. 98).

(19) Install first gear onto output shaft and over bearing.

(20) Install first gear bearing inner race onto output shaft and inside first gear bearing. Rotate bearing race until race installs over lock ball.

(21) Position output shaft rear bearing onto output shaft. Ensure that the snap ring groove in bearing outer race is toward rear of output shaft.

(22) With Driver L-4507 and mallet, drive bearing onto output shaft.

(23) Install snap-ring onto output shaft rear bearing outer race.

J8921-59

**Fig. 98 First Gear Components**

- 1 - REAR BEARING
- 2 - INNER RACE
- 3 - FIRST GEAR
- 4 - NEEDLE BEARING
- 5 - FIRST GEAR LOCK BALL

(24) Check first-second gear thrust clearance (Fig. 99). Standard clearance is 0.10 - 0.25 mm (0.004 - 0.010 in.). If clearance is out of specification, refer to Cleaning and Inspection.

J8921-61

**Fig. 99 First-Second Gear Thrust Clearance**

(25) Position fifth gear onto output shaft with the gear's short shoulder toward the rear of shaft. Ensure that the gear and output shaft splines are aligned.

(26) With Adapter 6747-1A, Driver L-4507 and a shop press, press fifth gear onto output shaft.

(27) Select the thickest snap-ring that will fit into the snap-ring groove of the output shaft (Fig. 100).

(28) Install snap-ring to hold fifth gear onto output shaft.

## MANUAL-NV3550

### REMOVAL - TRANSMISSION

- (1) Shift transmission into first or third gear.
- (2) Remove the floor console and shift boot as necessary to access the bottom of the shift lever at the shift tower attachment.
- (3) Install nuts on two M6X1.0 bolts and thread the bolts into the threaded holes at the base of the shift lever.
- (4) Tighten the nuts equally until the shift lever loosens on the shift tower stub shaft.
- (5) Remove the shift lever from the shift tower.
- (6) Raise and support vehicle on suitable safety stands.
- (7) Support engine with adjustable jack stand. Position wood block between jack and oil pan to avoid damaging pan.
- (8) Remove skid plate, if equipped.
- (9) Remove crossmember.
- (10) Disconnect necessary exhaust system components.
- (11) Remove slave cylinder (Fig. 1) from clutch housing.
- (12) Mark rear propeller shaft and rear axle yokes for installation alignment (Fig. 2).
- (13) Mark front propeller shaft, axle and transfer case yokes for installation alignment, if equipped.
- (14) Remove propeller shaft(s).
- (15) Unclip wire harnesses from transmission and transfer case, if equipped.
- (16) Disconnect transfer case vent hose, if equipped.
- (17) Disengage any wire connectors attached to transmission or transfer case, if equipped, components.
- (18) Support transfer case, if equipped, with transmission jack.

80be45f3

**Fig. 1 Slave Cylinder**

1 - CLUTCH SLAVE CYLINDER

- (19) Secure transfer case, if equipped, to jack with safety chains.
- (20) Disconnect transfer case shift linkage at transfer case, if equipped.
- (21) Remove nuts attaching transfer case to transmission, if equipped.
- (22) Remove transfer case, if equipped.
- (23) Remove crankshaft position sensor (Fig. 3).

**CAUTION:** It is important that the crankshaft position sensor be removed prior to transmission removal. The sensor can easily be damaged if left in place during removal operations.

## MANUAL-NV3550 (Continued)

J9316-2

**Fig. 2 Propeller Shaft And Axle Yokes**

1 - REFERENCE MARKS

80a0c62e

- 3 - MOUNTING BOLT(S)
- 4 - LEFT REAR OF ENGINE
- 5 - TRANSMISSION

(24) Support engine with adjustable jack stand. Position wood block between jack and oil pan to avoid damaging pan.

(25) Support transmission with transmission jack.

(26) Secure transmission to jack with safety chains.

(27) Disconnect rear cushion and bracket from transmission.

(28) Remove rear crossmember.

(29) Remove clutch housing-to-engine bolts.

(30) Pull transmission jack rearward until input shaft clears clutch. Then slide transmission out from under vehicle.

(31) Remove clutch release bearing, release fork and retainer clip.

(32) Remove clutch housing from transmission (Fig. 4).

80be45f0

## MANUAL-NV3550 (Continued)

**DISASSEMBLY****FRONT HOUSING**

- (1) Shift transmission into Neutral.
- (2) Remove drain plug and drain lubricant.
- (3) Inspect drain plug magnet for debris.
- (4) Remove backup light switch. Switch is located on passenger side of rear housing (Fig. 5).

**Fig. 5 BACKUP LIGHT SWITCH**

1 - BACKUP LIGHT SWITCH

- (5) Remove shift tower bolts and remove tower and lever assembly (Fig. 6).

**Fig. 6 SHIFT TOWER**

1 - SHIFT TOWER AND LEVER ASSEMBLY  
 2 - SHIFT SOCKET  
 3 - SEAL

- (6) Remove shift shaft lock bolt (Fig. 7) located on top of the housing just forward of shift tower.

**Fig. 7 SHIFT SHAFT LOCK BOLT**

1 - SHIFT SHAFT LOCK BOLT  
 2 - SHAFT SOCKET

- (7) Remove shift shaft detent plug with Remover 8117A. Attach the fingers of the remover to the detent plug (Fig. 8). Then push the cup down till it contacts the trans. Tighten the nut (Fig. 9) till it pulls the plug from the trans case.

**Fig. 8 DETENT PULLER**

1 - REMOVER 8117A  
 2 - DETENT PLUG

# MANUAL-NV3550 (Continued)

**Fig. 9 PULL DETENT PLUG**

- 1 - NUT

(16) Note position of input shaft, shift shaft and forks, and geartrain components in housing (Fig. 18).

### SHIFT/FORK SHAFTS AND REVERSE IDLER SEGMENT

(1) Unseat the roll pin that secures the shift socket to the shift shaft with Remover 6858 as follows:

- (a) Position remover on the shift shaft. Center the tool over the roll pin and verify that the tool legs are firmly seated on the shift socket (Fig. 19).
- (b) Tilt the socket toward the side of the case. This positions the roll pin at a slight angle to avoid trapping the pin between the gear teeth.
- (c) Tighten the tool to press the roll pin downward and out of the shift socket (Fig. 19).

**NOTE:** Press the roll pin just enough to clear the shift shaft. Be careful not to push the pin into the geartrain.

80a9b3b2

- 2 - 3-4 FORK

(6) Rotate 3-4 fork around synchro sleeve until fork clears shift arms on 1-2 and fifth-reverse forks, then remove 3-4 fork (Fig. 24).

**Fig. 24 3-4 SHIFT FORK**

- 1 - 3-4 FORK
- 2 - 1-2 AND 5TH-REVERSE FORK ARMS
- 3 - 3-4 SYNCHRO SLEEVE

## MANUAL-NV3550 (Continued)

(7) Remove the reverse idler shaft support bolt (front bolt) (Fig. 25).

(8) Loosen rear reverse idler shaft bolt (rear bolt) (Fig. 25).

**Fig. 25 REVERSE IDLER SHAFT/SUPPORT BOLT**

- 1 - SUPPORT BOLT
- 2 - SHAFT BOLT

(9) Remove reverse idler shaft support (Fig. 26) segment by sliding it straight out of housing.

**Fig. 26 IDLER SHAFT SUPPORT**

- 1 - IDLER SHAFT
- 2 - IDLER SHAFT SUPPORT

(10) Support geartrain and rear housing on Fixture 6747 as follows:

(a) Adjust height of reverse idler pedestal rod until the reverse idle shaft bottoms in Cup 8115.

(b) Position Adapters 6747-1A and 6747-2B on Fixture 6747.

(c) Slide fixture tool onto input shaft, countershaft and idler gear (Fig. 27).

(d) Stand geartrain and rear housing upright on fixture (Fig. 28). Have helper hold fixture tool in place while housing and geartrain is being rotated into upright position.

**Fig. 27 FIXTURE ASSEMBLY**

- 1 - FIXTURE
- 2 - ADAPTER 6747-1A
- 3 - CUP 8115

- 2 - COUNTERSHAFT
- 3 - SPECIAL TOOL 6747

(11) Remove rear bolt holding reverse idler shaft in housing.

**MANUAL-NV3550 (Continued)****REAR HOUSING - 2WD**

(1) On 2-wheel drive transmission, remove three bolts that attach output shaft bearing retainer to rear case (Fig. 29). Bolts are rear of shift tower opening.

J9421-50

**Fig. 29 OUTPUT SHAFT**

1 - OUTPUT SHAFT BEARING RETAINER BOLTS (THIRD BOLT IS AT OPPOSITE SIDE OF CASE)

(2) Unseat output shaft bearing from bearing bore in rear housing. Use plastic/rawhide mallet to tap rear housing upward and off output shaft bearing as shown (Fig. 30).

(3) Lift rear housing up and off geartrain (Fig. 31).

(4) Remove countershaft rear bearing from countershaft (Fig. 32).

(5) Examine condition of bearing bore and idler shaft notch in rear housing. Replace housing if any of these components are damaged.

J9421-49

**Fig. 30 REAR HOUSING - 2WD**

**Fig. 34 REAR SEAL - 4WD**

- 1 - SLIDE HAMMER
- 2 - REMOVER TOOL
- 3 - REAR SEAL

**REAR ADAPTER HOUSING - 4WD**

(1) Locate rear seal dimples (Fig. 33). With slide hammer mounted screw, remove rear seal by inserting screw into one of the seal dimples (Fig. 34).

J9421-197

**Fig. 33 SEAL DIMPLES - 4WD**

- 1 - LOCATION OF DIMPLES
- 2 - SEAL FACE

(2) Remove rear bearing snap ring from output shaft with snap ring pliers (Fig. 35).

J9421-201

**Fig. 35 REAR BEARING SNAP RING - 4WD**

- 1 - HEAVY DUTY SNAP RING PLIERS
- 2 - REAR BEARING SNAP RING
- 3 - OUTPUT SHAFT

**MANUAL-NV3550 (Continued)**

(3) Lift rear adapter housing upward and off geartrain (Fig. 36).

**Fig. 36 REAR ADAPTER HOUSING**

- 1 - REAR ADAPTER HOUSING  
2 - OUTPUT SHAFT

(4) Remove bearing retainer bolts and remove rear bearing retainer and rear bearing (Fig. 37). If needed push or tap bearing out of the housing with a hammer.

(5) Examine condition of bearing bore, countershaft rear bearing race and idler shaft notch in rear housing. Replace housing if race, bore or notch are worn or damaged.

**Fig. 37 REAR ADAPTER HOUSING COMPONENTS**

- 1 - BEARING RETAINER  
2 - RETAINER BOLTS (3)  
3 - IDLER SHAFT NOTCH  
4 - COUNTERSHAFT REAR BEARING RACE  
5 - REAR BEARING

**GEARTRAIN FROM FIXTURE**

(1) Remove reverse idler gear assembly from assembly fixture cup.

(2) Remove 1-2 and fifth-reverse forks from synchro sleeves.

(3) Slide countershaft out of fixture tool.

(4) Remove output shaft bearing retainer from rear surface of fifth gear (retainer will drop onto gear after bolts are removed).

(5) Lift and remove output shaft and gears off input shaft.

(6) Lift and remove input shaft, pilot bearing and fourth gear synchro ring from assembly fixture tool.

**OUTPUT SHAFT**

**NOTE:** The synchronizer hubs and sleeves are different and must not be intermixed. Remove each synchronizer unit as an assembly to avoid intermixing parts. Reference mark or tag each synchro hub and sleeve for correct assembly.

(1) Remove snap ring that secures 3-4 synchro hub on output shaft.

(2) Remove 3-4 synchro assembly, third gear synchro ring and third gear with shop press and Bearing Splitter 1130. Position splitter between second and third gears.

(3) Remove third gear needle bearing (Fig. 38).

**Fig. 38 THIRD GEAR NEEDLE BEARING**

- 1 - THIRD GEAR NEEDLE BEARING

## MANUAL-NV3550 (Continued)

(4) Remove retaining ring that secures two-piece thrust washer on shaft (Fig. 39). Use a small pry tool to remove retaining ring.

**Fig. 39 THRUST WASHER**

- 1 - PRY TOOL
- 2 - THRUST WASHER RETAINING RING

(5) Remove two-piece thrust washer (Fig. 40). Note position of washer locating lugs in shaft notches for installation reference.

**Fig. 40 TWO-PIECE THRUST WASHER**

- 6 - IDLER GEAR BEARING
- 7 - IDLER SHAFT
- 8 - THRUST WASHER
- 9 - SNAP RING
- 10 - THRUST WASHER LOCKBALLS

**REVERSE IDLER**

- (1) Remove idler gear snap rings (Fig. 51).
- (2) Remove thrust washer, wave washer, thrust plate and idler gear from shaft.
- (3) Remove idler gear needle bearing from shaft.

**ASSEMBLY**

Sealers are used at all case joints. Use Mopar Gas-ket Maker for all case joints and Mopar silicone sealer or equivalent, for the input shaft bearing retainer. Apply these products as indicated in the assembly procedures.

**CAUTION:** The transmission shift components must be in the Neutral position during assembly. This prevents damage to the synchro and shift components when the housings are installed.

**SYNCHRONIZER**

To assemble each synchro install the springs, struts and detent balls one at a time as follows:

- (1) Slide the sleeve part way onto the hub. Leave enough room to install the spring in the hub and the strut in the hub groove.
- (2) Install the first spring in the hub. Then install a strut over the spring. Be sure the spring is seated in the spring bore in the strut.
- (3) Slide the sleeve onto the hub just far enough to hold the first strut and spring in place.
- (4) Place the detent ball in the top of the strut. Then carefully work the sleeve over the ball to hold it in place. Use a small flat blade screwdriver to press the ball into place while moving the sleeve over it.

- (5) Repeat the procedure for the remaining springs, struts and balls. Tape or rubber band each strut and ball to temporarily secure as they are installed.

- (6) Verify synchro springs, struts and detent balls are all in place (Fig. 52).

J9421-57

**Fig. 52 SYNCHRONIZER COMPONENTS**

- 2 - HUB SHOULDER
- 3 - SPRING (3)
- 4 - STRUT (3)
- 5 - DETENT BALL (3)
- 6 - HUB

## MANUAL-NV3550 (Continued)

**OUTPUT SHAFT**

Lubricate shaft, gears and bearings with recommended lubricant during assembly. Petroleum jelly can be used to hold parts in place. Check bearing surfaces of output shaft for nicks or scratches. Smooth surfaces with 320/400 grit emery cloth if necessary. Apply oil to emery cloth and shaft surface before polishing.

Inspect and replace any synchro ring if worn or damaged. Immerse each synchro ring in lubricant before installation.

(1) Lubricate and install reverse gear needle bearing on shaft (Fig. 53). Slide bearing up against shoulder on output shaft.

**Fig. 53 REVERSE GEAR BEARING**

- 1 - REVERSE GEAR BEARING
- 2 - SHOULDER

(2) Install reverse gear over needle bearing (Fig. 54).

**Fig. 54 REVERSE GEAR**

- 1 - REVERSE GEAR

(3) Install brass synchro ring on reverse gear (Fig. 55).

(4) Assemble fifth-reverse synchro hub, sleeve, struts, springs and detent balls, if not previously done.

**Fig. 55 REVERSE SYNCHRO**

- 1 - REVERSE GEAR
- 2 - SYNCHRO RING

**CAUTION:** One side of the hub has shoulders around the hub bore, this side of the hub faces the front of the shaft. One side of the sleeve is tapered. The tapered side faces the front of the shaft.

(5) Start fifth-reverse synchro assembly on output shaft splines by hand. Then seat synchro onto shaft with a press and Cup 6310-1 (Fig. 56).

**Fig. 56 FIFTH-REVERSE SYNCHRO ASSEMBLY**

- 3 - REVERSE GEAR
- 4 - FIFTH-REVERSE SYNCHRO ASSEMBLY
- 5 - CUP
- 6 - PRESS BLOCKS
- 7 - OUTPUT SHAFT

**MANUAL-NV3550 (Continued)**

(6) Install new fifth-reverse hub snap ring (Fig. 57) and verify the snap ring is seated.

**NOTE:** Snap rings are available in thicknesses from 2.00 mm to 2.20 mm (0.078 to 0.086 in.). Install thickest snap ring that will fit in shaft groove.

**Fig. 57 FIFTH/REVERSE SYNCHRO HUB SNAP RING**

- 1 - FIFTH-REVERSE SYNCHRO ASSEMBLY
- 2 - SNAP RING
- 3 - PRESS BED
- 4 - PRESS BLOCKS

(7) Install fifth gear synchro ring in synchro hub and sleeve (Fig. 58).

**Fig. 58 FIFTH GEAR SYNCHRO RING**

- 1 - FIFTH-SPEED SYNCHRO RING
- 2 - FIFTH-REVERSE SYNCHRO ASSEMBLY

(8) Install fifth gear bearing, spreading bearing only enough to clear shoulder on output shaft (Fig. 59). Verify bearing is properly seated.

**Fig. 59 FIFTH GEAR BEARING**

- 1 - SHAFT SHOULDER
- 2 - FIFTH GEAR BEARING

(9) Install fifth gear on shaft and onto bearing (Fig. 60).

**Fig. 60 FIFTH GEAR**

- 1 - FIFTH GEAR
- 2 - BEARING

## MANUAL-NV3550 (Continued)

(10) Invert output shaft and set the shaft in Cup 6310-1 so that fifth gear is seated on the tool (Fig. 61).

(11) Install first gear bearing on output shaft (Fig. 61). Verify bearing is seated on shaft shoulder and is properly joined.

**Fig. 61 FIRST GEAR BEARING**

- 1 - FIRST GEAR BEARING
- 2 - SHAFT SHOULDER
- 3 - SPECIAL TOOL 6310-1
- 4 - PRESS BLOCKS

(12) Install first gear on shaft and over bearing with bearing synchro cone facing up (Fig. 62).

(13) Install first gear synchro ring (Fig. 63).

(14) Assemble 1-2 synchro hub sleeve, springs, struts and detent balls.

**CAUTION:** The 1-2 synchro hub and sleeve can be installed backwards. One side of the synchro sleeve is marked First Gear Side. Verify this side of the sleeve is facing first gear.

**Fig. 62 FIRST GEAR**

- 5 - LUG
- 6 - WASHER HALF

**MANUAL-NV3550 (Continued)**

(24) Start retaining ring around two-piece thrust washer (Fig. 71). Ensure locating dimple is between the thrust washer halves.

**Fig. 71 RETAINING RING**

- 1 - THRUST WASHER RETAINING RING
- 2 - THRUST WASHER HALVES
- 3 - SECOND GEAR
- 4 - LOCATING DIMPLE

(25) Seat thrust washer retaining ring with plastic mallet (Fig. 72).

**Fig. 72 THRUST RETAINER**

- 1 - PLASTIC MALLET
- 2 - THRUST WASHER RETAINING RING

(26) Install third gear needle bearing on shaft (Fig. 73).

**Fig. 73 THIRD GEAR BEARING**

- 1 - THIRD GEAR BEARING

(27) Install third gear on shaft and bearing (Fig. 74).

**Fig. 74 THIRD GEAR**

- 1 - THIRD GEAR
- 2 - BEARING

## MANUAL-NV3550 (Continued)

(28) Install third speed synchro ring on third gear (Fig. 75).

**Fig. 75 THIRD SPEED SYNCHRO RING**

- 1 - THIRD SPEED SYNCHRO RING
- 2 - THIRD GEAR

(29) Assemble 3-4 synchro hub, sleeve, springs, struts and detent balls.

(30) Start 3-4 synchro hub on output shaft splines by hand (Fig. 76).

**CAUTION:** The 3-4 synchro hub and sleeve can be installed backwards. One side of the sleeve has grooves in it. This side of sleeve faces the front of the shaft.

**Fig. 76 3-4 SYNCHRO HUB ON OUTPUT SHAFT**

- 1 - GROOVED SIDE OF SLEEVE (TO FRONT)
- 2 - 3-4 SYNCHRO ASSEMBLY

(31) Press 3-4 synchro assembly onto output shaft with shop press and suitable size pipe tool (Fig. 77).

**NOTE:** Place the pipe on hub as close to output shaft as possible without contacting the shaft splines.

**Fig. 77 PRESS 3-4 SYNCHRO ON OUTPUT SHAF**

- 1 - PRESS RAM
- 2 - PIPE TOOL
- 3 - 3-4 SYNCHRO
- 4 - THIRD SPEED SYNCHRO RING

(32) Install 3-4 synchro hub snap ring (Fig. 78) and verify snap ring is seated.

**NOTE:** Snap rings are available in thicknesses from 2.00 mm to 2.30 mm (0.078 to 0.090 in.). Install thickest snap ring that will fit in shaft groove.

**Fig. 78 3-4 SYNCHRO HUB SNAP RING**

- 1 - 3-4 SYNCHRO HUB SNAP RING
- 2 - SNAP RING PLIERS

## MANUAL-NV3550 (Continued)

(33) Install output shaft bearing.

(34) Install output shaft bearing snap ring, spreading it just enough to install it (Fig. 79). Verify snap ring is seated in shaft groove.

(35) Verify position of synchro sleeves before proceeding with assembly operations (Fig. 80). Grooved side of 3-4 sleeve should be facing forward. First gear side of 1-2 sleeve should be facing first gear. Tapered side of fifth-reverse sleeve should be facing forward.

J9421-67

## MANUAL-NV3550 (Continued)

**REVERSE IDLER ASSEMBLY**

- (1) Lubricate idler components with gear lube.
- (2) Slide idler gear bearing on shaft (Fig. 81). Bearing fits either way on shaft.
- (3) Slide gear onto shaft. Side of gear with recess goes to rear (Fig. 81).
- (4) Place first lock ball in dimple at rear end of idler shaft (Fig. 81). Hold ball in place with petroleum jelly.

**Fig. 81 IDLER GEAR AND BEARING**

- 1 - IDLER GEAR
- 2 - BEARING
- 3 - LOCK BALL
- 4 - REAR OF SHAFT

- (5) Slide thrust rear thrust washer onto shaft and over lock ball (Fig. 82).
- (6) Install snap ring in groove at rear of shaft (Fig. 82).

**Fig. 82 IDLER GEAR REAR THRUST WASHER**

- 1 - LOCK BALL
- 2 - SNAP RING GROOVE
- 3 - THRUST WASHER

- (7) Install lock ball in dimple at front of shaft. Hold ball in place with petroleum jelly.
- (8) Install front thrust washer on shaft and slide washer up against gear and over lock ball (Fig. 83).
- (9) Install wave washer, flat washer and remaining snap ring on idler shaft (Fig. 83). Verify snap ring is seated.

**Fig. 83 IDLER GEAR AND SHAFT ASSEMBLY**

- 1 - REAR OF SHAFT
- 2 - GEAR
- 3 - THRUST WASHER AND BALL
- 4 - WAVE WASHER
- 5 - FLAT WASHER
- 6 - FRONT OF SHAFT
- 7 - SNAP RING
- 8 - SNAP RING

**SHIFT SHAFT AND BUSHINGS/BEARINGS**

Inspect shift shaft bushing and bearing for damage and replace if necessary.

- (1) Locate a bolt that will thread into the bushing without great effort.
- (2) Thread the bolt into the bushing, allowing the bolt to make its own threads in the bushing.
- (3) Attach a slide hammer or suitable puller to the bolt and remove bushing.
- (4) Use the short end of Installer 8119 to install the new bushing.
- (5) The bushing is correctly installed if the bushing is flush with the transmission case.
- (6) To replace the bearing locate a bolt that will thread into the bearing without great effort.
- (7) Thread the bolt into the bearing as much as possible.

**MANUAL-NV3550 (Continued)**

(8) Attach a slide hammer or suitable puller to the bolt and remove the bearing.

(9) Use the short end of Installer 8119 to install the new bearing.

(10) The bearing is correctly installed if the bearing is flush with the transmission case.

**DETENT PLUNGER BUSHING**

Inspect detent plunger bushings for damage and replace if necessary.

**NOTE:** The detent plunger bushings are installed to a specific depth. The space between the two bushings when correctly installed contain an oil feed hole. Do not attempt to install the bushings with anything other than the specified tool or this oil hole may become restricted.

(1) Using the long end of Installer 8119, drive the detent bushings through the outer case and into the shift shaft bore.

(2) Remove the bushings from the shift shaft bore.

(3) Install a new detent plunger bushing on the long end of Installer 8118.

(4) Start the bushing in the detent plunger bore in the case.

(5) Drive the bushing into the bore until the tool contacts the transmission case.

(6) Install a new detent plunger bushing on the short end of Installer 8118.

(7) Start the bushing in the detent plunger bore in the case.

(8) Drive the bushing into the bore until the tool contacts the transmission case.

**GEARTRAIN ASSEMBLY**

(1) Install Adapter 6747-1A on input shaft hub of Fixture 6747 (Fig. 84).

(2) Install input shaft in fixture tool. Make sure Adapter 6747-1A is positioned under shaft as shown (Fig. 85).

(3) Install pilot bearing in input shaft (Fig. 85).

**NOTE:** The side of the pilot bearing with the small diameter goes toward the input shaft.

80aa0eaa

**Fig. 84 ASSEMBLY FIXTURE**

4 - SPECIAL TOOL 6747

80aa0eab

**Fig. 85 PILOT BEARING AND INPUT SHAFT**

1 - PILOT BEARING

2 - INPUT SHAFT

## MANUAL-NV3550 (Continued)

(4) Install fourth gear synchro ring on input shaft (Fig. 86).

**Fig. 86 FOURTH GEAR SYNCHRO**

- 1 - FOURTH GEAR SYNCHRO RING  
2 - INPUT SHAFT

(5) Adjust height of idler gear pedestal on assembly fixture (Fig. 87). Start with a basic height of 18.4 cm (7-1/4 in.). Final adjustment can be made after gear is positioned on pedestal.

**Fig. 87 IDLER PEDESTAL BASIC HEIGHT**

- 1 - REVERSE IDLER PEDESTAL

(6) Install assembled output shaft and geartrain in input shaft (Fig. 88). Carefully rotate output shaft until the 3-4 synchro ring seats in synchro hub and sleeve.

**Fig. 88 OUTPUT SHAFT AND GEARTRAIN**

- 1 - OUTPUT SHAFT AND GEARTRAIN  
2 - INPUT SHAFT  
3 - SPECIAL TOOL 6747

(7) Install Adapter 6747-2B on front bearing hub of countershaft. The adapter has a shoulder on one side that goes towards the countershaft.

(8) Slide countershaft (and adapter) into fixture slot. Verify countershaft and output shaft gears are fully meshed with the mainshaft gears (Fig. 89).

(9) Check alignment of countershaft and output shaft gear teeth. Note that gears may not align perfectly. A difference in height of 1.57 to 3.18 mm (1/16 to 1/8 in.) will probably exist. This difference will not interfere with assembly.

## MANUAL-NV3550 (Continued)

**Fig. 89 COUNTERSHAFT ON FIXTURE**

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT (SLIDE INTO PLACE ON FIXTURE TOOL)

(10) Position reverse idler in support cup of assembly fixture (Fig. 90). Ensure idler gear is properly meshed and aligned with shaft gear teeth and that bolt holes are facing out and not toward geartrain. Adjust pedestal up or down if necessary. Also be sure that short end of idler shaft is facing up as shown.

(11) On 2-wheel drive transmission, thread one Alignment Pin 8120 in center or passenger side hole of output shaft bearing retainer. Then position retainer on fifth gear as shown (Fig. 91).

(12) Assemble 1-2 and fifth reverse-shift forks (Fig. 92). Arm of fifth-reverse fork goes through slot in 1-2 fork.

(13) Install assembled shift forks in synchro sleeves (Fig. 93). Verify forks are properly seated in sleeves.

**Fig. 90 REVERSE IDLER ASSEMBLY POSITION**

- 1 - OUTPUT SHAFT AND GEARTRAIN

- 3 - DOWEL FLUSH WITH SURFACE

**Fig. 93 SHIFT FORKS IN SYNCHRO**

- 1 - SYNCHRO SLEEVES
- 2 - FORK ARMS
- 3 - SHIFT FORKS

## REAR HOUSING - 2WD

(1) Drive adapter housing alignment dowels back into housing until dowels are flush with mounting surface (Fig. 94).

(2) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(3) Install countershaft rear bearing in bearing race (Fig. 95).

**Fig. 95 COUNTERSHAFT REAR BEARING**

- 1 - COUNTERSHAFT REAR BEARING
- 2 - REAR BEARING RACE
- 3 - REAR HOUSING
- 4 - PETROLEUM JELLY

## MANUAL-NV3550 (Continued)

**CAUTION:** Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 96).

(4) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(5) Apply light coat of petroleum jelly to shift shaft bushing/bearing in rear housing (Fig. 96).

(6) Reach into countershaft rear bearing with finger and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation.

**Fig. 96 COUNTERSHAFT REAR BEARING SEATED**

- 1 - SHIFT SHAFT BUSHING/BEARING
- 2 - COUNTERSHAFT REAR BEARING (SEATED IN RACE)

(7) Install rear housing onto geartrain (Fig. 97). Verify bearing retainer pilot stud is in correct bolt hole in housing. Also be sure countershaft and output shaft bearings are aligned in housing and on countershaft. It may be necessary to lift upward on countershaft slightly to ensure that the countershaft rear bearing engages to the countershaft before the rear output shaft bearing engages the housing.

(8) Seat rear housing on output shaft rear bearing and countershaft. Use plastic or rawhide mallet to tap housing into place.

(9) Apply Mopar Gasket Maker or equivalent, to housing bolt threads, bolt shanks and under bolt heads (Fig. 98).

**Fig. 97 REAR HOUSING - 2WD**

- 1 - REAR HOUSING
- 2 - SHIFT FORKS AND GEARTRAIN

**Fig. 98 SEAL RETAINING BOLTS**

- 1 - MOPAR GASKET MAKER (OR LOCTITE 518)
- 2 - RETAINER AND HOUSING BOLTS
- 3 - APPLY SEALER TO UNDERSIDE OF BOLT HEAD, SHANK AND THREADS

## MANUAL-NV3550 (Continued)

(10) Start first two bolts in retainer (Fig. 99). It may be necessary to move retainer rearward (with pilot stud) in order to start bolts in retainer.

(11) Remove Alignment Pin 8120 and install last retainer bolt (Fig. 99).

(12) Tighten all three retainer bolts to 30-35 N-m (22-26 ft. lbs.).

**Fig. 99 PILOT STUD AND RETAINER BOLTS - 2WD**

- 2 - RETAINER BOLT
- 3 - IDLER SHAFT NOTCH
- 4 - COUNTERSHAFT BEARING RACE
- 5 - REAR BEARING

### ADAPTER HOUSING - 4WD

(1) Install rear bearing in adapter housing. Use wood hammer handle or wood dowel to tap bearing into place.

(2) Position rear bearing retainer in adapter housing (Fig. 100).

(3) Apply Mopar Gasket Maker or equivalent, to threads, bolt shanks and under hex heads of bearing retainer bolts (Fig. 98).

(4) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(5) Install countershaft rear bearing in bearing race (Fig. 96).

**CAUTION:** Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 96).

(6) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(7) Apply light coat of petroleum jelly to shift shaft bushing/bearing in adapter housing (Fig. 96).

(8) Install adapter housing on geartrain.

(9) Install rear bearing snap ring on output shaft (Fig. 101).

J9421-201

**Fig. 101 REAR BEARING SNAP RING - 4WD**

- 1 - SNAP RING PLIERS
- 2 - SNAP RING
- 3 - OUTPUT SHAFT

## MANUAL-NV3550 (Continued)

(10) Lubricate lip of new rear seal (Fig. 102) with Mopar Door Ease or transmission fluid.

(11) Install new rear seal in adapter housing bore with Installer C-3860-A. Verify seal is seated in housing bore (Fig. 102).

**Fig. 102 REAR SEAL**

- 1 - REAR SEAL
- 2 - SEAL LIP
- 3 - OUTPUT SHAFT

### SHIFT SHAFT, SHAFT LEVER AND BUSHING AND SHIFT SOCKET

(1) Verify that all synchro sleeves are in Neutral position (centered on hub).

**CAUTION:** The transmission synchros must all be in Neutral position for assembly. Otherwise the housings, shift forks and gears can be damaged during installation of the two housings.

(2) Install 3-4 shift fork in synchro sleeve (Fig. 103). Verify that groove in fork arm is aligned with grooves in 1-2 and fifth-reverse fork arms as shown.

(3) Slide the end of shift shaft with shaft detent notches through 3-4 shift fork.

(4) Assemble shift shaft shift lever and bushing (Fig. 104). Be sure slot in bushing is facing up and roll pin hole for lever is aligned with hole in shaft.

**Fig. 103 3-4 SHIFT FORK**

- 1 - 3-4 FORK
- 2 - ALIGN GROOVES IN FORK ARMS

**Fig. 104 LEVER AND BUSHING**

- 1 - SHAFT LEVER
- 2 - LEVER BUSHING
- 3 - BUSHING LOCK PIN SLOT

(5) Install assembled lever and bushing on shift shaft (Fig. 105).

(6) Slide shift shaft through 1-2 and fifth-reverse fork and into shift lever opening in rear housing (Fig. 106).

(7) Align shift socket with shaft and slide shaft through socket and into shift shaft bearing in rear housing (Fig. 107).

(8) Rotate shift shaft so detent notches in shaft are facing the TOP of the transmission housing.

## MANUAL-NV3550 (Continued)

**Fig. 105 LEVER AND BUSHING ASSEMBLY**

- 1 - SHIFT SHAFT
- 2 - SHAFT LEVER AND BUSHING
- 3 - 3-4 FORK

**Fig. 106 SHAFT IN LEVER OPENING**

- 1 - SHIFT SHAFT

**CAUTION:** Positioning of the shift shaft detent notch is important. Both of the shaft roll pins can be installed even when the shaft is 180° off. If this occurs, the transmission will have to be disassembled again to correct shaft alignment.

(9) Select correct new roll pin for shift shaft lever (Fig. 108). Shaft lever roll pin is approximately 22 mm (7/8 in.) long. Shift socket roll pin is approximately 33 mm (1-1/4 in.) long.

(10) Align roll pin holes in shift shaft, lever and bushing. Then start roll pin into shaft lever by hand (Fig. 109).

**Fig. 107 SHIFT SOCKET**

- 1 - SHIFT SOCKET
- 2 - SHIFT SHAFT

J9421-86

**Fig. 108 ROLL PIN IDENTIFICATION**

- 2 - SHIFT SOCKET ROLL PIN

**Fig. 109 ROLL PIN IN SHIFT SHAFT**

- 1 - SHAFT LEVER ROLL PIN
- 2 - LEVER AND BUSHING

## MANUAL-NV3550 (Continued)

(11) Seat shaft lever roll pin with pin punch (Fig. 110).

**CAUTION:** The shaft lever roll pin must be flush with the surface of the lever. The lever bushing will bind on the roll pin if the pin is not seated flush.

(12) Verify that lock pin slot in lever bushing is positioned as shown (Fig. 110).

**Fig. 110 SHIFT SHAFT LEVER ROLL**

- 1 - BUSHING LOCK PIN SLOT
- 2 - SEAT ROLL PIN FLUSH WITH LEVER

(13) Align roll pin holes in shift socket and shift shaft. Then start roll pin into shift shaft by hand (Fig. 111).

**Fig. 111 ROLL PIN IN SHIFT SOCKET**

- 1 - ROLL PIN
- 2 - SHIFT SOCKET
- 3 - SHIFT SHAFT

(14) Seat roll pin in shift socket with pin punch. Roll pin must be flush with socket (Fig. 112).

**Fig. 112 SEATING SHIFT SOCKET ROLL PIN**

- 1 - PIN PUNCH
- 2 - SHIFT SOCKET
- 3 - SEAT ROLL PIN FLUSH
- 4 - SHIFT SOCKET

(15) Verify that notches in shift fork arms are aligned. Realign arms if necessary.

## FRONT HOUSING AND INPUT SHAFT BEARING RETAINER

(1) Install reverse blocker, retainer and retainer bolt in front housing.

(2) If previously removed, input shaft bearing in front housing (Fig. 113). Install snap ring and use plastic mallet to seat bearing. Bearing goes in from front side of housing only.

(3) Apply liberal quantity of petroleum jelly to countershaft front bearing. Then insert bearing in front housing race (Fig. 113). Large diameter side of bearing cage goes toward countershaft (Fig. 114). Small diameter side goes toward bearing race in housing.

(4) Reach into countershaft front bearing with finger, and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation.

(5) Apply small amount of petroleum jelly to shift shaft bushing in front housing.

## MANUAL-NV3550 (Continued)

**Fig. 113 INPUT SHAFT AND COUNTERSHAFT FRONT BEARING**

- 1 - INPUT SHAFT BEARING
- 2 - COUNTERSHAFT FRONT BEARING
- 3 - SHIFT SHAFT BUSHING

**Fig. 114 COUNTERSHAFT FRONT BEARING**

- 1 - BEARING RACE
- 2 - PETROLEUM JELLY
- 3 - COUNTERSHAFT FRONT BEARING

(6) Apply 1/8 in. wide bead of Mopar Gasket Maker or equivalent, to mating surfaces of front and rear housings (Fig. 115).

(7) Have helper hold rear housing and geartrain in upright position. Then install front housing on rear housing and geartrain.

(8) Work front housing downward onto geartrain until seated on rear housing.

J9421-123

**Fig. 115 SEAL FRONT/REAR HOUSINGS**

- 1 - HOUSING FLANGE SURFACE
- 2 - MOPAR GASKET MAKER (OR LOCTITE 518)

**CAUTION:** If the front housing will not seat on the rear housing, either the shift components are not in Neutral, or one or more components are misaligned. Do not force the front housing into place. This will only result in damaged components.

(9) Tap rear housing alignment dowels back into place with hammer and pin punch. Both dowels should be flush fit in each housing. Have helper hold transmission upright while dowels are tapped back into place.

(10) Place transmission in horizontal position.

(11) Apply Mopar Gasket Maker or equivalent to housing attaching bolts. Apply sealer material sealer to underside of bolt heads and to bolt shanks and threads (Fig. 116).

(12) Install and start housing attaching bolts by hand (Fig. 116). Then tighten bolts to 34 N·m (25 ft. lbs.).

(13) Install shift shaft bushing lock bolt (Fig. 117). Apply Mopar Gasket Maker or equivalent, to bolt threads, shank and underside of bolt head before installation.

**CAUTION:** If the lock bolt cannot be fully installed, do not try to force it into place. Either the shift shaft is not in Neutral or the shaft bushing (or lever) is misaligned.

## MANUAL-NV3550 (Continued)

2 - SHAFT SOCKET

(14) Lubricate then install shift shaft detent plunger in housing bore (Fig. 118). Lubricate plunger with petroleum jelly or gear lubricant. **Verify plunger is fully seated in detent notch in shift shaft.**

(15) Install detent spring inside plunger (Fig. 118).

(16) Install plug on detent spring and compress spring. Then drive detent plug into transmission case until plug seats.

(17) Install backup light switch (Fig. 119).

(18) Install input shaft snap ring (Fig. 120).

(19) Install new oil seal in front bearing retainer with Installer 6448 (Fig. 121).

**Fig. 121 OIL SEAL IN FRONT BEARING RETAINER**

- 1 - INSTALLER  
2 - FRONT BEARING RETAINER

(20) Apply bead of Mopar silicone sealer or equivalent to flange surface of front bearing retainer (Fig. 122).

**Fig. 122 SEAL BEARING RETAINER AND HOUSING**

- 1 - APPLY SEALER BEAD  
2 - INPUT SHAFT BEARING RETAINER

(21) Align and install front bearing retainer over input shaft and onto housing mounting surface (Fig. 123). Although retainer is one-way fit on housing, be sure bolt holes are aligned before seating retainer.

**NOTE:** Ensure no sealer gets into the oil feed hole in the transmission case or bearing retainer.

**Fig. 123 INPUT SHAFT BEARING RETAINER**

- 1 - INPUT SHAFT  
2 - OIL FEED  
3 - BEARING RETAINER

(22) Install and tighten bearing retainer bolts to 7-10 N·m (5-7 ft. lbs.) (Fig. 124).

**Fig. 124 BEARING RETAINER BOLTS**

- 1 - RETAINER BOLTS

## MANUAL-NV3550 (Continued)

**SHIFT TOWER AND LEVER**

- (1) Apply petroleum jelly to ball end of shift lever and interior of shift socket.
- (2) Shift the transmission into third gear.
- (3) Align and install shift tower and lever assembly (Fig. 125). Be sure shift ball is seated in socket and the offset in the tower is toward the passenger side of the vehicle before installing tower bolts.
- (4) Install shift tower bolts (Fig. 126). Tighten bolts to 8.5 N·m (75.2 in. lbs.).

**Fig. 125 SHIFT TOWER**

- 1 - SHIFT TOWER  
2 - SHIFT SOCKET  
3 - SEAL

**Fig. 126 SHIFT TOWER BOLTS**

- 1 - SHIFT TOWER BOLT

- (5) Fill transmission to bottom edge of fill plug hole with Mopar Transmission Lubricant.
- (6) Install and tighten fill plug to 34 N·m (25 ft. lbs.).
- (7) Check transmission vent. Be sure vent is open and not restricted.

**INSTALLATION - TRANSMISSION**

- (1) Install clutch housing on transmission and tighten housing bolts to 46 N·m (34 ft. lbs.).
- (2) Lubricate contact surfaces of release fork pivot ball stud and release fork with high temp grease.
- (3) Install release bearing, fork and retainer clip.
- (4) Position and secure transmission on transmission jack.
- (5) Lightly lubricate pilot bearing and transmission input shaft splines with Mopar high temp grease.
- (6) Raise transmission and align transmission input shaft and clutch disc splines. Then slide transmission into place.
- (7) Install and tighten clutch housing-to-engine bolts to: **Be sure the housing is properly seated on engine block before tightening bolts.**
  - Tighten 3/8" diameter bolts to 37 N·m (27 ft.lbs.).
  - Tighten 7/16" diameter bolts to 58 N·m (43 ft.lbs.).
  - Tighten M12 bolts to 75 N·m (55 ft.lbs.).
- (8) Be sure transmission is in first or third gear.
- (9) Install rear crossmember and tighten crossmember-to-frame bolts to 41 N·m (31 ft. lbs.).
- (10) Install fasteners to hold rear cushion and bracket to transmission. Then tighten transmission-to-rear support bolts/nuts to 54 N·m (40 ft. lbs.).
- (11) Remove support stands from engine and transmission.
- (12) Install and connect crankshaft position sensor.
- (13) Position transfer case on transmission jack, if equipped.
- (14) Secure transfer case to jack with safety chains, if equipped.
- (15) Raise transfer case if equipped and align transfer case input shaft to the transmission output shaft.
- (16) Slide transfer case forward until case is seated on transmission, if necessary.
- (17) Install nuts to attach transfer case to transmission, if equipped. Tighten transfer case-to-transmission nuts to 35 N·m (26 ft. lbs.).
- (18) Connect transfer case shift linkage at transfer case, if equipped.
- (19) Connect transfer case vent hose, if equipped.
- (20) Secure wire harnesses in clips/tie straps on transmission and transfer case if equipped.
- (21) Engage wire connectors attached to all necessary transmission or transfer case, if equipped, components.
- (22) Install rear propeller shaft slip yoke to transmission or transfer case output shaft if equipped.
- (23) Install rear propeller shaft with reference marks aligned (Fig. 127).

## MANUAL-NV3550 (Continued)

**Fig. 127 Propeller Shaft**

1 - REFERENCE MARKS

(24) Install and tighten propeller shaft U-joint clamp bolts to 19 N·m (170 in. lbs.).

(25) Align marks on front propeller shaft, axle and transfer case yokes, if equipped.

(26) Install and tighten propeller shaft U-joint clamp bolts to 19 N·m (170 in. lbs.).

(27) Install slave cylinder in clutch housing.

(28) Install skid plate, if equipped and tighten bolts to 42 N·m (31 ft. lbs.). Tighten stud nuts to 17 N·m (150 in. lbs.).

(29) Fill transmission and transfer case if equipped, with recommended lubricants. Refer to the Lubricant Recommendation sections of the appropriate component for correct fluid.

(30) Lower vehicle.

(31) Install nuts on two M6X1.0 bolts and thread the bolts into the threaded holes at the base of the shift lever.

(32) Tighten the nuts equally until the shift lever will slide over the shift tower stub shaft.

(33) Install the floor console and shift boot.

## VEHICLE SPEED SENSOR

### DESCRIPTION

The 3-wire Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the extension housing of the transfer case (drivers side). If equipped with 2WD, this adapter is located on the left side of the transmission extension housing.

### OPERATION

The VSS is a 3-circuit (3-wire), magnetic, hall-effect sensor.

The 3 circuits are:

- A 5-volt power supply from the Powertrain Control Module (PCM).
- A ground is provided for the sensor through a low-noise sensor return circuit in the PCM.
- An input to the PCM is used to determine vehicle speed and distance traveled.

The speed sensor generates 8 pulses per sensor revolution. These signals, in conjunction with a closed throttle signal from the throttle position sensor, indicate a closed throttle deceleration to the PCM. When the vehicle is stopped at idle, a closed throttle signal is received by the PCM (but a speed sensor signal is not received).

Under deceleration conditions, the PCM adjusts the Idle Air Control (IAC) motor to maintain a desired MAP value. Under idle conditions, the PCM adjusts the IAC motor to maintain a desired engine speed.

### REMOVAL

The Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the transfer case extension (left side) (Fig. 128). If equipped with 2WD, this adapter is located on the extension housing of the transmission (left side).

- (1) Raise and support vehicle.
- (2) Disconnect electrical connector from sensor by pushing slide tab (Fig. 128). After slide tab has been positioned, push in on secondary release lock (Fig. 128) on side of connector and pull connector from sensor.
- (3) Remove sensor mounting bolt (Fig. 129).
- (4) Remove sensor (pull straight out) from speedometer pinion gear adapter (Fig. 129). Do not remove gear adapter from transmission.

**Fig. 128 VSS Location**

## VEHICLE SPEED SENSOR (Continued)

### INSTALLATION

- (1) Clean inside of speedometer pinion gear adapter before installing speed sensor.
- (2) Install sensor into speedometer gear adapter and install mounting bolt. Before tightening bolt, verify speed sensor is fully seated (mounted flush) to speedometer pinion gear adapter.
- (3) Tighten sensor mounting bolt to 2.2 N·m (20 in. lbs.) torque.
- (4) Connect electrical connector to sensor.

## EXTENSION HOUSING

### REMOVAL

- (1) Raise and support vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Remover C-3985-B (Fig. 130) from transmission housing.

**Fig. 130 YOKE SEAL**

- 1 - REMOVER  
2 - SEAL

### REMOVAL

- (1) Raise and support vehicle.
- (2) Mark reference lines on the propeller shaft and remove the shaft.
- (3) Remove housing yoke seal.
- (4) Insert Remover 6957 into rear housing and tighten tool to bushing and remove bushing (Fig. 131).

**Fig. 131 Bushing Removal - Typical**

- 1 - REMOVER 6957  
2 - EXTENSION HOUSING BUSHING

### INSTALLATION

- (1) Place seal in position on transmission housing.
- (2) Drive new seal into transmission housing with Installer C-3972-A and Handle C-4171 (Fig. 132).
- (3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines.
- (4) Install propeller shaft with reference marks aligned.

**Fig. 132 Yoke Seal Installer**

- 1 - HANDLE  
2 - INSTALLER

- (5) Remove support and lower vehicle.
- (6) Check transmission fluid level.

## EXTENSION HOUSING (Continued)

**INSTALLATION**

(1) Align bushing oil hole with oil slot in rear housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Installer C-3972-A (Fig. 133).

(4) Install propeller shaft with reference marks aligned.

(5) Remove support and lower vehicle.

DISASSEMBLY.....	77

## AUTOMATIC - 30RH

### DISASSEMBLY

- (1) Remove transmission from vehicle.
- (2) Install a suitable tail shaft housing plug to avoid contaminating internal components with cleaning solvents.
- (3) Clean exterior of transmission with suitable solvent or pressure washer.
- (4) Remove torque converter from transmission.
- (5) Remove throttle and shift levers from valve body manual shaft and throttle lever shaft.
- (6) Mount transmission in repair stand C-3750-B or similar type stand (Fig. 1).
- (7) Remove extension housing.
- (8) Remove fluid pan.
- (9) Remove park/neutral position switch and seal (Fig. 2).
- (10) Remove valve body.
- (11) Remove accumulator spring and piston (Fig. 3).

80a4836c

**Fig. 3 Accumulator Piston And Spring**

- 1 - ACCUMULATOR PISTON
- 2 - PISTON SPRING

- (12) Measure input shaft end play (Fig. 4).
  - (a) Attach Adapter 8266-7 to Handle 8266-8.
  - (b) Attach dial indicator C-3339 to Handle 8266-8.
  - (c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-7 to secure it to the input shaft.

## AUTOMATIC - 30RH (Continued)

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading.

80c070b6

**Fig. 4 Checking Input Shaft End Play**

- 1 - TOOL 8266-8
- 2 - TOOL 8266-7
- 3 - TOOL C-3339

(13) Loosen front band adjusting screw lock nut (Fig. 5) 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 6).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 6).

(17) Loosen front band adjusting screw until band is completely loose (Fig. 5).

(18) Squeeze front band together and remove band strut (Fig. 7).

## DESCRIPTION

**This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual information is in the 2000 Model Year Service Manual.**

**When you are using this information you may be referred to another section of the Service Manual. The refer to is written differently than in prior years.**

## OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through third gear are

obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assembly to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in third gear when the vehicle is cruising on a level plane after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

## AUTOMATIC - 32RH (Continued)

**PARK POWERFLOW**

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front-clutch-hub and rear-clutch-retainer stops at the rear-clutch-retainer. Therefore, no power flow to the output shaft, occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 1), which locks the parking gear on the output shaft to the transmission case.

80c070a6

**Fig. 1 Park Powerflow**

- 1 - LEVER ENGAGED FOR PARK
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT

**NEUTRAL POWERFLOW**

With the gear selector in the neutral position (Fig. 2), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

80a06c8f

**Fig. 2 Neutral Powerflow**

- 1 - LEVER DISENGAGED FOR NEUTRAL
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT
- 4 - CAM
- 5 - LEVER

## AUTOMATIC - 32RH (Continued)

**REVERSE POWERFLOW**

When the gear selector is moved into the reverse position (Fig. 3), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pin-

ions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

- 8 - LOW/REVERSE BAND APPLIED

## AUTOMATIC - 32RH (Continued)

**FIRST GEAR POWERFLOW**

When the gearshift lever is moved into the drive position the transmission goes into first gear (Fig. 4). As soon as the transmission is shifted from park or neutral to drive, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear

planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

80c070a9

- 3 - REAR CLUTCH APPLIED
- 4 - OUTPUT SHAFT

- 5 - OVER-RUNNING CLUTCH HOLDING
- 6 - INPUT SHAFT
- 7 - REAR CLUTCH APPLIED
- 8 - INPUT SHAFT

## AUTOMATIC - 32RH (Continued)

**SECOND GEAR POWERFLOW**

In drive-second (Fig. 5), the same elements are applied as in manual-second. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In drive-second, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed.

Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

80c070aa

## AUTOMATIC - 32RH (Continued)

**DIRECT DRIVE POWERFLOW**

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 6). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front

annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

## AUTOMATIC - 32RH (Continued)

**DIAGNOSIS AND TESTING - PRELIMINARY**

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

**VEHICLE IS DRIVEABLE**

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform hydraulic pressure test if shift problems were noted during road test.
- (6) Perform air-pressure test to check clutch-band operation.

**VEHICLE IS DISABLED**

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift or throttle linkage.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
- (4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
  - (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
  - (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.
  - (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

**DISASSEMBLY**

- (1) Drain fluid from transmission.
- (2) Clean exterior of transmission with suitable solvent or pressure washer.
- (3) Remove torque converter from front of transmission.
- (4) Remove throttle and shift levers from valve body manual shaft and throttle lever shaft.
- (5) Mount transmission in repair stand C-3750-B or similar type stand (Fig. 7).
- (6) Remove extension housing.
- (7) Remove fluid pan.
- (8) Remove park/neutral position switch and seal (Fig. 8).
- (9) Remove valve body.
- (10) Remove accumulator spring and piston (Fig. 9).

**Fig. 9 Accumulator Piston And Spring**

- 1 - ACCUMULATOR PISTON  
2 - PISTON SPRING

(11) Measure input shaft end play (Fig. 10).

(a) Attach Adapter 8266-7 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-7 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading.

2 - TOOL 8266-7  
3 - TOOL C-3339

(12) Remove front band reaction pin access plug (Fig. 11). Plug is accessible through converter housing. Use 1/4 inch drive extension to remove plug as shown.

J9121-119

**Fig. 11 Front Band Reaction Pin Access Plug**

- 1 - 1/4" DRIVE EXTENSION  
2 - FRONT BAND REACTION PIN ACCESS PLUG

(13) Loosen front band adjusting screw lock nut (Fig. 12) 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

80c070ac

**Fig. 12 Front Band Adjusting Screw Lock Nut**

- 1 - LOCK-NUT  
2 - FRONT BAND ADJUSTER

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 13).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 13).

(17) Loosen front band adjusting screw until band is completely loose.

## AUTOMATIC - 32RH (Continued)

(18) Squeeze front band together and remove band strut (Fig. 14).

(19) Remove front band reaction pin with pencil magnet. Pin is accessible from converter housing side of case (Fig. 15).

(20) Remove front band lever (Fig. 16).

## AUTOMATIC - 32RH (Continued)

(21) Slide front band rearward and onto driving shell. Band will not be removed until after front/rear clutch removal.

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 17).

(23) Lift front clutch off rear clutch (Fig. 18). Set clutch units aside for overhaul.

(24) Remove output shaft thrust washer from output shaft, or from rear clutch hub.

(25) Remove output shaft thrust plate from output shaft hub (Fig. 19).

(26) Slide front band off driving shell (Fig. 20) and remove band from case.

(27) Remove governor body and park gear from output shaft.

(28) Remove output shaft and planetary geartrain as assembly (Fig. 21). Support geartrain with both hands during removal. Do not allow machined surfaces on output shaft to become nicked or scratched.

(29) Loosen rear band adjusting screw 4-5 turns (Fig. 22).

(30) Remove snap-ring that secures low-reverse drum to rear support hub, however do not remove drum at this time (Fig. 23).

(31) Remove rear band upper and lower reaction pins with parallel jaw snap-ring pliers (Fig. 24). Spread plier jaws in pin bore to grip pin. Then twist and pull pins to remove them as shown.

(32) Remove rear band lever and strut.

(33) Mark position of rear support for assembly reference (Fig. 25). Use scribe or center punch to mark case and support.

(34) Remove rear support bolts and remove support from low-reverse drum and case (Fig. 26). Keep rear support bolts together for assembly reference.

(35) Remove bolts attaching overrunning clutch cam to case (Fig. 27).

**Fig. 27 Overrunning Clutch Cam Bolt Locations**

- 1 - OVERRUNNING CLUTCH CAM BOLTS

## AUTOMATIC - 32RH (Continued)

(36) Remove low-reverse drum and overrunning clutch as assembly. Slide drum and clutch through rear band and out of case. Set drum and clutch assembly aside for cleaning and inspection.

(37) Remove rear band from case.

(38) Compress front servo rod guide about 1/8 in. with Spring Compressor Tool C-3422-B (Fig. 28).

(39) Remove front servo rod guide snap-ring (Fig. 28). **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(40) Remove compressor tools and remove front servo rod guide, spring and servo piston.

(41) Compress rear servo spring retainer about 1/16 in. with Spring Compressor Tool C-3422-B.

(42) Remove rear servo spring retainer snap-ring. Then remove compressor tools and remove rear servo spring and piston.

**Fig. 28 Compressing Front Servo Rod Guide**

- 1 - SPRING COMPRESSOR TOOL C-3422-B  
2 - ROD GUIDE SNAP-RING

## ASSEMBLY

## SERVO

(1) Install rear servo piston, spring and spring retainer. Compress rear servo spring and retainer with Compressor Tool C-3422-B.

(2) Install front servo piston, spring and rod guide. Compress front servo rod guide with Valve Spring Compressor C-3422-B and install servo snap-ring (Fig. 28).

## OVERRUNNING CLUTCH

(1) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 29). This hole must align with blank area in clutch cam bolt circle (Fig. 30).

(2) Mark location of non threaded hole in clutch cam and blank area of case with paint stripe (Fig. 31).

(3) Align and install overrunning clutch cam in case (Fig. 31). **Be sure cam is correctly installed. Bolt holes in cam are slightly countersunk on one side. This side of cam faces rearward (toward rear support).**

(4) Partially install overrunning clutch in cam (Fig. 31).

(5) Verify that non threaded hole in clutch cam is properly aligned (Fig. 31). Check alignment by threading a clutch cam bolt into each hole. Adjust cam position if necessary before proceeding.

(6) Seat overrunning clutch in clutch cam after verifying correct cam alignment.

(7) Install overrunning clutch cam bolts. **Clutch cam bolts are shorter than rear support bolts.** Tighten cam bolts to 17 N-m (150 in. lbs. or 13 ft. lbs.) torque.

(8) Lubricate overrunning clutch rollers, springs and cam with Mopar® ATF +4 transmission fluid.

**Fig. 29 Location Of Non-Threaded Hole In Clutch Cam**

- 4 - WIDE SPACE AREA

## REAR BAND

The 32RH transmission has a double wrap band, a pivot pin, and a reaction pin (Fig. 32). The band lever pivots against a lug on the band. The reaction pin functions as the stop, or locating mechanism for the band lower lug.

(1) Install band components and low-reverse drum as follows:

(2) Install reaction pin in case (Fig. 33).

(3) Position band in case and seat band lug against reaction pin.

**Fig. 32 Rear Band Components**

- 1 - ADJUSTING SCREW
- 2 - LOCKNUT
- 3 - LEVER
- 4 - REAR BAND
- 5 - REACTION PIN
- 6 - O-RINGS
- 7 - PIVOT PIN

(4) Slide low-reverse drum through band (Fig. 34). Then tilt drum slightly and start clutch race into overrunning clutch rollers.

(5) Rotate drum in clockwise direction and push drum inward until race is seated in overrunning clutch.

(6) Install rear band lever (Fig. 35). Be sure lever pivot pin is fully seated in case afterward.

**Fig. 33 Rear Band Reaction Pin**

- 1 - REAR BAND REACTION PIN

## AUTOMATIC - 32RH (Continued)

**Fig. 34 Rear Band And Low-Reverse Drum**

- 4 - SPRING
- 5 - SPRING RETAINER
- 6 - SERVO SNAP-RING

**REAR SUPPORT AND LOW-REVERSE DRUM**

(1) Hold low-reverse drum in position and install rear support (Fig. 36).

(2) Align support with punch marks made during disassembly.

(3) Install and tighten rear support bolts to 17 N·m (150 in. lbs.) torque.

(4) Install snap-ring that retains low-reverse drum to hub of rear support (Fig. 37).

**Fig. 36 Rear Support**

- 1 - OIL PAN FACE
- 2 - TRANSMISSION HOUSING
- 3 - REAR SUPPORT

**Fig. 37 Low-Reverse Drum Snap-Ring**

## AUTOMATIC - 32RH (Continued)

## PLANETARY GEARTRAIN AND OUTPUT SHAFT

(1) Lubricate output shaft, rear support bore and low-reverse drum hub with transmission fluid.

(2) Install assembled output shaft and planetary geartrain in case (Fig. 38).

(3) Align drive lugs on rear planetary gear with slots in low-reverse drum (Fig. 39). Then seat planetary assembly in drum.

**Fig. 38 Output Shaft And Planetary Geartrain**

- 1 - SLOTS
- 2 - LOW-REVERSE DRUM

- 5 - LUGS

**Fig. 39 Aligning/Seating Rear Planetary In Low-Reverse Drum**

- 1 - LOW-REVERSE DRUM SLOTS
- 2 - REAR PLANETARY GEAR DRIVE LUGS
- 3 - DRIVING SHELL

## GOVERNOR AND PARK GEAR

(1) Lubricate governor components and park gear seal rings with Mopar® ATF +4.

(2) Install governor filter in park gear and install governor body on gear. Align governor body on gear using marks made at disassembly.

(3) Install new seal rings on hub of park gear if necessary. Be sure ring with hooked ends is properly connected.

(4) Align and install governor/park gear assembly on output shaft as follows:

(a) **Note that output shaft in current transmission is spotfaced for governor valve end clearance (Fig. 40). Shaft must be indexed so that small end of governor valve will seat in this spotface. Install governor body and park as follows to ensure proper alignment and operation.**

(b) Rotate output shaft until spotface (at governor valve shaft hole) is facing upward (Fig. 40).

(c) Position valve bore in governor body over spotface on output shaft. Then align valve shaft holes in governor body and output shaft.

(d) Align splines in output shaft and park gear hub.

(e) Carefully push assembly into place in rear support (Fig. 41).

(f) Verify that governor valve shaft holes in output shaft and governor body are still in alignment. Reposition governor body and park gear if alignment is not correct.

(g) Tighten bolts attaching governor body to park gear to 11 N·m (95 in. lbs.) torque.

(5) Install first E-clip on governor valve shaft. Then install governor valve and shaft in governor body (Fig. 42). **Be sure valve shaft moves freely in valve and in output shaft. If valve shaft binds, governor/park gear is misaligned.**

(6) Rotate output shaft until opposite end of governor valve shaft is facing upward. Then install remaining E-clip on governor valve shaft (Fig. 43). **Be very sure both E-clips are firmly seated on shaft.**

(7) Install governor body-park gear retaining snap-rings and washer on output shaft as follows:

(a) On models with single snap-ring, install snap-ring. Be sure ring is seated in shaft.

(b) On models with thrust washer and two snap-rings, install thin snap-ring first. Then install thrust washer second, and thick snap-ring last (Fig. 44).

(c) Verify correct position of snap-rings. **Be sure flat side of each snap-ring is toward governor body.**

(8) Tighten bolts that attach governor body to park gear to 11 N·m (95 in. lbs.).

## FRONT/REAR CLUTCH

(1) Install output shaft thrust plate on shaft hub (Fig. 45). Use petroleum jelly to hold thrust plate in place.

(2) Check input shaft seal rings. Verify that diagonal-cut ends of teflon seal ring are properly joined and ends of plastic ring are correctly positioned. Also be sure rings are installed in sequence shown.

(3) Check rear clutch thrust washer. Use additional petroleum jelly to hold washer in place if necessary.

(4) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 46). Rotate front clutch retainer back and forth until completely seated on rear clutch.

(5) Coat output shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 47). Use enough petroleum jelly to hold washer in place. **Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub.**

(6) Align drive teeth on rear clutch discs with small screwdriver (Fig. 48). This will make installation on front planetary easier.

**Fig. 45 Output Shaft Thrust Plate**

- 1 - OUTPUT SHAFT HUB
- 2 - OUTPUT SHAFT THRUST PLATE

**Fig. 48 Aligning Rear Clutch Disc Lugs**

- 1 - REAR CLUTCH DISCS
- 2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

(7) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(8) Install front and rear clutch units as assembly (Fig. 49). Align rear clutch with front annulus gear and install assembly in driving shell. **Be sure output shaft thrust washer and thrust plate are not displaced during installation.**

(9) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Verify that front clutch drive lugs are fully engaged in slots of driving shell after installation.

**Fig. 49 Installing Front/Rear Clutch**

- 1 - INPUT SHAFT
- 2 - FRONT CLUTCH
- 3 - REAR CLUTCH

**FRONT BAND AND OIL PUMP**

(1) Slide front band over front clutch retainer (Fig. 50).

(2) Insert front band reaction pin part way into case (Fig. 50).

(3) Install front band lever, strut, lever pin and adjusting screw (Fig. 51).

(4) Tighten front band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

(5) Coat band lever pin access plug with sealer and install plug in converter housing (Fig. 52).

(6) Verify that reaction shaft support hub seal rings are hooked together (Fig. 53).

(7) Coat front clutch thrust washer with petroleum jelly to hold it in place. Then install washer over reaction shaft hub and seat it on pump (Fig. 54).

**CAUTION:** The thrust washer bore (I.D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.

## AUTOMATIC - 32RH (Continued)

(8) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump flange (Fig. 55).

(9) Align and install oil pump gasket (Fig. 55).

(10) Lubricate oil pump seals with Mopar® Door-Ease, or Ru-Glyde, Door Eze, or ATF Plus 4.

(11) Install oil pump (Fig. 56). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install two or three pump bolts to hold pump in place.

(12) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

**Fig. 55 Installing Pilot Studs And Gasket**

## CHECKING INPUT SHAFT END PLAY

(1) Measure input shaft end play (Fig. 57).

**NOTE:** If end play is incorrect, transmission is incorrectly assembled, or output shaft thrust washer and/or thrust plate are worn and need to be changed.

- (a) Attach Adapter 8266-7 to Handle 8266-8.
- (b) Attach dial indicator C-3339 to Handle 8266-8.
- (c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-7 to secure it to the input shaft.
- (d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
- (e) Move input shaft in and out and record reading. End play should be 0.56 - 2.31 mm (0.022 - 0.091 in.).

## AUTOMATIC - 32RH (Continued)

**VALVE BODY**

(1) Install new manual lever shaft seal in case. Use suitable deep well socket to install seal.

(2) Make sure neutral switch has **not** been installed in case. Remove switch if necessary as it will interfere with valve body installation.

(3) Install new seal rings on accumulator piston (Fig. 58). Lubricate accumulator piston, seals and accumulator bore with transmission fluid.

(4) Install accumulator piston and spring (Fig. 58) in case.

(5) Place valve body manual lever in low to move park lock rod rearward.

(6) Position valve body on case. Work park rod past sprag and install valve body-to-case bolts finger tight.

(7) Install park/neutral position switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

(8) Align valve body on case (Fig. 59).

(9) Install and tighten valve body-to-case bolts alternately and evenly to 12 N·m (105 in. lbs.) torque. Start at center and work outward when tightening bolts. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.**

(10) Connect converter clutch solenoid wire to case connector (Fig. 59).

(11) Install new filter on valve body (Fig. 60). Tighten filter screws to 4 N·m (35 in. lbs.).

## AUTOMATIC - 32RH (Continued)

**Fig. 60 Fluid Filter Installation**

- 1 - FLUID FILTER  
2 - FILTER SCREWS

(2) Position new extension housing gasket on transmission case. Use petroleum jelly to hold gasket in place.

(3) Install new rear seal in extension housing if required.

(4) Install extension housing on transmission case. Tighten housing fasteners to 33 N·m (24 ft. lbs.). Be sure park lock rod is properly engaged in sprag beforehand.

(5) Lubricate converter hub with transmission fluid and carefully install converter. Turn converter back and forth until seated.

(6) Secure converter in oil pump before mounting transmission on jack and before moving transmission back under vehicle. Use metal strapping, C-clamp, or locking pliers to hold converter in place. Attach holding tool to converter housing.

## EXTENSION HOUSING, CONTROL LEVER AND CONVERTER

(1) Install throttle valve and transmission shift levers on manual valve shaft. Tighten lever clamp screws securely.

## SPECIFICATIONS

### 32RH AUTOMATIC TRANSMISSION

#### SPECIFICATIONS

COMPONENT	METRIC	INCH
Oil pump gear tip clearance	0.089-0.190 mm	0.0035-0.0075 in.
Planetary end play	0.127-1.22 mm	0.005-0.048 in.
Input shaft end play	0.56-2.31 mm	0.022-0.091 in.
Clutch pack clearance/Front 4-disc.	1.70-3.40 mm	0.067-0.134 in.
Clutch pack clearance/Rear 4-disc.	0.81-1.40 mm	0.032-0.055 in.
Front clutch spring usage	1 spring	
Front Band adjustment from 72 in. lbs.	Back off 2.25 turns	
Rear Band adjustment from 41 in. lbs.	Back off 4 turns	
Recommended fluid	Mopar®, ATF +4, Type 9602	

## AUTOMATIC - 32RH (Continued)

**THRUST WASHER/SPACER/SNAP-RING DIMENSIONS**

COMPONENT	METRIC	INCH
Front clutch thrust washer (reaction shaft support hub)	1.55 mm	0.061 in.
Rear clutch thrust washer (clutch retainer)	1.55 mm	0.061 in.
Output shaft thrust plate (output shaft pilot hub)	1.5-1.6mm	0.060-0.063 in.
Output shaft thrust washer (rear clutch hub)	1.3-1.4 mm	0.052-0.054 in.
	1.7-1.8 mm	0.068-0.070 in.
	2.1-2.2 mm	0.083-0.086 in.
Rear clutch pack snap-ring	1.5 mm	0.060 in.
	1.7 mm	0.068 in.
	1.9 mm	0.076 in.

## ACCUMULATOR

## INSPECTION

Inspect the accumulator piston and seal rings (Fig. 61). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 61). Replace the springs if the coils are cracked, distorted or collapsed.

**Fig. 61 Accumulator Components**

- 1 - INNER SPRING
- 2 - ACCUMULATOR PISTON
- 3 - OUTER SPRING
- 4 - SEAL RINGS

## BANDS

## ADJUSTMENT - FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 62). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N-m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and the appropriate Torx™ socket.

**CAUTION:** If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N-m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 2-1/4 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N-m (30 ft. lbs.) torque.
- (6) Lower vehicle.

## BANDS (Continued)

**Fig. 62 Front Band Adjusting Screw Lock Nut**

- 1 - LOCK-NUT  
2 - FRONT BAND ADJUSTER

**ADJUSTMENTS - REAR BAND**

The transmission oil pan must be removed for access to the rear band adjusting screw.

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 5 N·m (41 in. lbs.) (Fig. 63).
- (5) Back off adjusting screw 4 turns.
- (6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.
- (7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.
- (8) Lower vehicle and refill transmission with Mopar® ATF +4, Type 9602, fluid.

**FLUID AND FILTER****DIAGNOSIS AND TESTING - FLUID CONTAMINATION**

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair

**Fig. 63 Rear Band Adjustment Screw Location**

- 1 - 30RH REAR BAND LEVER AND ADJUSTING SCREW  
2 - 32RH REAR BAND LEVER AND ADJUSTING SCREW

- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary cool-

## FLUID AND FILTER (Continued)

ers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 64) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not over-fill.

**Fig. 64 Dipstick Fluid Level Marks - Typical**

1 - DIPSTICK

2 - MAXIMUM CORRECT FLUID LEVEL

3 - ACCEPTABLE FLUID LEVEL

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

## FLUID AND FILTER (Continued)

**CAUTION:** Do not overfill transmission, fluid foaming and shifting problems can result.

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

## STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

- (1) Hoist and support vehicle on safety stands.
- (2) Remove the transmission/skip plate as necessary to access the transmission oil pan.
- (3) Place a large diameter shallow drain pan beneath the transmission pan.
- (4) Remove bolts holding front and sides of pan to transmission (Fig. 65).
- (5) Loosen bolts holding rear of pan to transmission.
- (6) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
- (7) Hold up pan and remove remaining bolts holding pan to transmission.
- (8) While holding pan level, lower pan away from transmission.
- (9) Pour remaining fluid in pan into drain pan.
- (10) Remove screws holding filter to valve body (Fig. 66).
- (11) Separate filter from valve body and pour fluid in filter into drain pan.
- (12) Dispose used trans fluid and filter properly.
- (13) Inspect bottom of pan and magnet for excessive amounts of metal or fiber contamination. A light coating of clutch or band material on the bottom of the pan does not indicate a problem unless accompanied by slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts or debris, refer to the diagnosis section of this group.
- (14) Using a suitable solvent, clean pan and magnet.
- (15) Using a suitable gasket scraper, clean gasket material from gasket surface of transmission case and the gasket flange around the pan.
- (16) Place replacement filter in position on valve body.
- (17) Install screws to hold filter to valve body (Fig. 66). Tighten screws to 4 N·m (35 in. lbs.) torque.
- (18) Place new gasket in position on pan, and install pan on transmission.
- (19) Place pan in position on transmission.

8031e88b

**Fig. 65 Transmission Pan - Typical**

- 1 - GASKET
- 2 - PAN
- 3 - TRANSMISSION

803f5843

**Fig. 66 Transmission Filter - Typical**

- 1 - FILTER
- 2 - TRANSMISSION

(20) Install screws to hold pan to transmission (Fig. 65). Tighten bolts to 17 N·m (150 in. lbs.) torque.

(21) Install the transmission/skip plate.

(22) Lower vehicle and fill transmission with Mopar® ATF Plus 4, type 9602 fluid.

## FRONT CLUTCH

### OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

### DISASSEMBLY

(1) Remove waved snap-ring and remove pressure plate, clutch plates and clutch discs (Fig. 67).

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 68). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

(6) Remove seals from clutch retainer piston bore and clutch retainer hub. Discard both seals as they are not reusable.

### ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seals in the clutch retainer lower groove and on the outer diameter of the retainer hub. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of the retainer seals with liberal quantity of Mopar® Door Ease. Then lubricate retainer hub, bore, and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 69). Use twisting motion to seat piston in bottom of retainer.

**CAUTION:** Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip.

## FRONT CLUTCH (Continued)

- 3 - RETAINER SNAP-RING
- 4 - SPRING RETAINER

- (5) Position spring in clutch piston (Fig. 70).
- (6) Position spring retainer on top of piston spring. Make sure retainer is properly installed (Fig. 67).

**Fig. 69 Front Clutch Piston Installation**

- 1 - CLUTCH PISTON
- 2 - FRONT CLUTCH RETAINER

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 68). Then install new snap ring to secure spring retainer and spring.

(8) Install clutch plates and discs. Install steel plate then disc until all plates and discs are installed.

(9) Install pressure plate and waved snap-ring.

**Fig. 70 Clutch Piston Spring Installation**

- 1 - RETAINER
- 2 - CLUTCH SPRING
- 3 - PISTON

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs, plates, pressure plates and snap ring may have to be changed.

## GEAR SHIFT CABLE

## REMOVAL

- (1) Shift transmission into PARK.
- (2) Remove shift lever bezel and necessary console parts for access to shift lever assembly. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (3) Disconnect cable at shift lever and feed cable through dash panel opening to underside of vehicle.
- (4) Raise vehicle.
- (5) Disengage cable eyelet at transmission shift lever and pull cable adjuster out of mounting bracket. Then remove old cable from vehicle.

## INSTALLATION

- (1) Route cable through hole in dash panel. Fully seat cable grommet into dash panel.
- (2) Place the auto transmission manual shift control lever in "PARK" detent (rearmost) position and rotate prop shaft to ensure transmission is in PARK.
- (3) Connect shift cable to shifter mechanism by snapping cable retaining ears into shifter bracket and press cable end fitting onto lever ball stud.
- (4) Place the floor shifter lever in PARK position. Ensure that the pawl is seated within the confines of the adjustment gauge clip.
- (5) Snap the cable into the transmission bracket so the retaining ears are engaged and connect cable end fitting onto the manual control lever ball stud.
- (6) Lock shift cable into position by pushing upward on the adjusting lock button.
- (7) Remove and discard the shift cable adjustment gauge clip from the park gate of the shifter.

## GEAR SHIFT CABLE (Continued)

(8) Install any floor console components removed previously. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

**ADJUSTMENT - GEARSHIFT CABLE**

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is OK if the engine starts only in these positions. Adjustment is incorrect if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the transmission range sensor may be faulty.

**Gearshift Adjustment Procedure**

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Release cable adjuster clamp (at transmission end of cable) to unlock cable.
- (4) Unsnap cable from cable mounting bracket on transmission (Fig. 71).
- (5) Slide cable eyelet off transmission shift lever.
- (6) Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
- (7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
- (8) Slide cable eyelet onto transmission shift lever.
- (9) Snap shift cable adjuster into mounting bracket on transmission.
- (10) Lock shift cable by pressing cable adjuster clamp down until it snaps into place.
- (11) Lower vehicle and check engine starting. Engine should start only in PARK and NEUTRAL.

**GOVERNOR AND PARK GEAR****DISASSEMBLY**

- (1) Remove governor body from transmission.
- (2) Clean and inspect governor filter (Fig. 72).
- (3) Remove snap-ring and washer that secure governor weight assembly in body (Fig. 73).
- (4) Remove governor weight assembly from governor body bore.
- (5) Slide intermediate and inner weight from outer weight.
- (6) Position intermediate weight on suitable size socket (Fig. 74).
- (7) Push inner weight downward with nut driver. Then remove inner weight snap-ring with Snap-Ring Pliers 6823 (Fig. 74).
- (8) Remove inner weight and spring from intermediate weight (Fig. 75).

- 9 - WASHER

80a47367

**Fig. 75 Intermediate and Inner Governor Weights**

- 1 - INTERMEDIATE WEIGHT
- 2 - INNER WEIGHT
- 3 - SNAP-RING

**ASSEMBLY**

**CAUTION:** Exercise care when installing the seal rings. They are easily broken if overspread or twisted during installation.

If it was necessary to remove the park gear, inspect the seal rings and bore in rear support. Install new seal rings on park gear hub only if original rings are damaged, or worn. Install ring with interlock ends first and ring with plain ends last. Slip each ring on hub and seat them in grooves. Verify that rear ring ends are securely interlocked before proceeding. If the bore in rear support is damaged, replace the rear support.

(1) Lubricate governor components with Mopar® ATF +4, Type 9602 transmission fluid before assembly.

(2) Clean and inspect governor weights and bores for scoring or wear. Replace the governor body and weights if damaged.

(3) Insert spring into intermediate weight.

(4) Insert inner weight into intermediate weight and install snap-ring (Fig. 75). Verify snap-ring is fully seated in groove in intermediate weight (Fig. 74).

(5) Assemble governor weights into governor body (Fig. 73).

(6) Install washer and snap-ring to hold weights in governor body.

(7) Install governor body in transmission

J9521-33

## PARK/NEUTRAL POSITION SWITCH

### DESCRIPTION

The park/neutral position switch (Fig. 76) is threaded into the side of the transmission case, just above the transmission oil pan mounting surface. The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

**Fig. 76 Park/Neutral Position Switch**

- 1 - NEUTRAL CONTACT
- 2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
- 3 - PARK CONTACT
- 4 - SWITCH

### OPERATION

The park/neutral position switch is operated by the manual lever of the valve body. When the valve body is in the PARK or NEUTRAL positions, the center terminal of the park/neutral position switch is grounded to the transmission case through the manual lever.

When the valve body is in the REVERSE position, the manual lever depresses the park/neutral position switch and connects the outer two terminals of the switch to provide continuity for the back-up lamp circuit.

## REAR SERVO

### DISASSEMBLY

- (1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 77).
- (2) Remove and discard servo piston seal ring.

**Fig. 77 Rear Servo Components**

- 1 - SNAP-RING
- 2 - PISTON SEAL
- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP-RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

### ASSEMBLY

(1) Lubricate piston and guide seals (Fig. 78) with petroleum jelly. Lubricate other servo parts with Mopar® ATF +4, type 9602, transmission fluid.

- (2) Install new seal ring on servo piston.
- (3) Assemble piston, plug, spring and new snap-ring.
- (4) Lubricate piston seal lip with petroleum jelly.

**Fig. 78 Rear Servo Components**

- 1 - SNAP-RING
- 2 - PISTON SEAL
- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP-RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

## SHIFT MECHANISM

### DESCRIPTION

The shift mechanism is cable operated and provides six shift positions. The shift indicator is located on the console next to the gear shift. The shift positions are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual Second (2)
- Manual Low (1)

### OPERATION

Manual low (1) range provides first gear only. Over run braking is also provided in this range. Manual second (2) range provides first and second gear only. Drive range provides first, second, and third gear ranges.

## THROTTLE VALVE CABLE

### ADJUSTMENT - THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

**Fig. 79 Throttle Cable Attachment At Engine**

- 1 - TRANSMISSION THROTTLE VALVE CABLE
- 2 - ACCELERATOR CABLE
- 3 - CABLE ENGINE BRACKET
- 4 - THROTTLE BODY
- 5 - CABLE GUIDE

### ADJUSTMENT VERIFICATION

- (1) Turn ignition key to OFF position.
- (2) Remove air cleaner.
- (3) Verify that lever on throttle body is at curb idle position (Fig. 79). Then verify that transmission throttle lever (Fig. 80) is also at idle (fully forward) position.

J9321-414

**Fig. 80 Throttle Cable Attachment At Transmission**

- 1 - RETURN SPRING
- 2 - THROTTLE VALVE CABLE
- 3 - THROTTLE VALVE CABLE BRACKET
- 4 - THROTTLE VALVE LEVER
- 5 - GEAR SELECTOR LEVER
- 6 - SHIFT CABLE BRACKET

(4) Slide cable off attachment stud on throttle body lever.

(5) Compare position of cable end to attachment stud on throttle body lever:

- Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 81).

- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

## THROTTLE VALVE CABLE (Continued)

80bce9fb

**Fig. 81 Throttle Valve Cable at Throttle Linkage**

- 1 - THROTTLE LINKAGE
- 2 - THROTTLE VALVE CABLE LOCKING CLIP
- 3 - THROTTLE VALVE CABLE

**ADJUSTMENT PROCEDURE**

- (1) Turn ignition switch to OFF position.
- (2) Remove air cleaner if necessary.

(3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Pry the T.V. cable lock (A) into the UP position (Fig. 81). This will unlock the cable and allow for readjustment.

(6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable. **Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 81).

(7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 81). This will lock the present T.V. cable adjustment.

**NOTE:** Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

TRANSFER CASE-NV231

DISASSEMBLY

Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

REAR RETAINER AND OIL PUMP

- (1) Remove the speedometer adapter.
- (2) Spread band clamp which holds output shaft boot to the output shaft slinger, or output shaft damper, with a suitable awl, or equivalent.

**NOTE:** Vehicles built with a 4.0L engine and a manual transmission use a damper weight on the transfer case output shaft. Be sure to identify the transfer case before proceeding.

- (3) Remove output shaft boot from slinger, or output shaft damper, and output shaft.
- (4) If the vehicle is not equipped with an output shaft damper, remove the output shaft rear slinger using Puller MD-998056-A (Fig. 1).

Fig. 1 Rear Slinger Removal

- 1 - TRANSFER CASE
- 2 - SPECIAL TOOL MD-998056-A
- 3 - SLINGER

- (5) If the vehicle is equipped with an output shaft damper, use Screws 8421 and the puller yoke and forcing screw from a bolt-grip puller set, such as those used to remove steering wheels and harmonic balancers, to remove the transfer case output shaft damper.

(6) Use a suitable pry tool, or a slide hammer mounted screw, to remove the seal from the rear retainer (Fig. 2).

(7) Remove the rear output bearing I.D. retaining ring (Fig. 3).

(8) Remove the bolts holding the rear retainer to the rear case half.

80c070b7

Fig. 2 Rear Retainer Seal

## TRANSFER CASE-NV231 (Continued)

**YOKE AND RANGE LEVER**

- (1) Remove transfer case indicator switch.
- (2) Remove front yoke nut as follows:
  - (a) Move range lever to 4L position.
  - (b) Then remove nut with socket and impact wrench (Fig. 7).
- (3) Remove yoke. If yoke is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller (Fig. 8). Be sure puller tool is positioned on yoke and not on slinger as slinger will be damaged.

**Fig. 7 Yoke Nut Removal**

- 1 - IMPACT WRENCH  
2 - SOCKET  
3 - YOKE

**Fig. 8 Yoke Removal**

- 1 - PULLER TOOL  
2 - YOKE

- (5) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft (Fig. 9).

**Fig. 9 Range Lever Removal**

- 1 - RANGE LEVER  
2 - SECTOR SHAFT

**FRONT OUTPUT SHAFT AND DRIVE CHAIN**

- (1) Support transfer case so rear case is facing upward.
- (2) Remove bolts holding front case to rear case. The case alignment bolts require flat washers (Fig. 10).
- (3) Loosen rear case with flat blade screwdriver to break sealer bead. Insert pry tool blade only into notches provided at each end of case (Fig. 11).
- (4) Remove rear case from front case.

**Fig. 10 Rear Case Alignment Bolt Locations**

- 1 - DOWEL BOLT AND WASHER (2)  
2 - CASE BOLT (5)  
3 - SPLINE HEAD BOLT (1)

- (4) Remove seal washer from front output shaft. Discard washer as it should not be reused.

## TRANSFER CASE-NV231 (Continued)

**Fig. 11 Loosening Rear Case**

## TRANSFER CASE-NV231 (Continued)

J9321-36

**Fig. 31 Rear Tabbed Thrust Washer Removal**

- 1 - LOW RANGE GEAR  
2 - REAR TABBED THRUST WASHER

**ASSEMBLY**

Lubricate transfer case components with Mopar® ATF +4, type 9602, Automatic Transmission Fluid or petroleum jelly (where indicated) during assembly.

**BEARINGS AND SEALS**

**CAUTION:** The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

- (1) Remove the front output shaft seal from case with pry tool (Fig. 32).
- (2) Remove the front output shaft bearing retaining ring with screwdriver (Fig. 33).
- (3) Remove bearing with Tool Handle C-4171 and Tool 5065 (Fig. 34).

2 - SPECIAL TOOL 5064

**Fig. 37 Front Output Seal Installation**

- 1 - INSTALLER 8143-A  
2 - TRANSFER CASE

(5) Install output shaft front bearing retaining ring (Fig. 36). Start ring into place by hand. Then use small screwdriver to work ring into case groove. Be sure ring is fully seated before proceeding.

**Fig. 36 Installing Output Shaft Front Bearing Retaining Ring**

- 1 - WORK RETAINING RING INTO BORE GROOVE WITH SMALL SCREWDRIVER

(6) Install new front output seal in front case with Installer Tool 8143-A as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 37). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(7) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 38).

(8) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 39). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 40).

**Fig. 38 Output Shaft Rear Bearing Removal**

 2 - CHAMFER

(9) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from inside the annulus gear opening in the case (Fig. 41).

(10) Install locating ring on new bearing.

(11) Position case so forward end is facing upward.

J9521-43

**Fig. 41 Input Shaft Bearing Removal**

- 1 - SPECIAL TOOL C-4171  
 2 - SPECIAL TOOL C-4210

(12) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated against case surface (Fig. 42).

J8921-219

**Fig. 42 Seating Input Shaft Bearing**

- 1 - SNAP-RING  
 2 - INPUT SHAFT BEARING

## TRANSFER CASE-NV231 (Continued)

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 43).

(14) Install new pilot bearing with Installer 5065 and Handle C-4171 (Fig. 44).

80a11090

**Fig. 43 Remove Input Gear Pilot Bearing**

- 1 - DRIFT
- 2 - INPUT GEAR

(15) Remove front bearing retainer seal with suitable pry tool.

(16) Install new front bearing retainer seal with Installer 7884 (Fig. 45).

(17) Remove seal from oil pump housing with a suitable pry tool

(18) Install new seal in oil pump housing with Installer 7888 (Fig. 46).

(19) Remove rear retainer bearing with Installer 8128 and Handle C-4171.

(20) Install rear bearing in retainer with Handle C-4171 and Installer 5064 (Fig. 47).

8001b777

4 - LOW RANGE GEAR  
5 - THRUST WASHERS

**Fig. 47 Installing Rear Bearing In Retainer**

- 1 - SPECIAL TOOL C-4171  
2 - SPECIAL TOOL 5064  
3 - REAR RETAINER

**INPUT AND LOW RANGE GEAR**

(1) Install first thrust washer in low range gear (Fig. 48). Be sure washer tabs are properly aligned in gear notches.

(2) Install input gear in low range gear. Be sure input gear is fully seated.

(3) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(4) Install retainer on input gear and install snap-ring.

**INPUT GEAR AND LOW RANGE GEAR**

(1) Align and install low range/input gear assembly in front case (Fig. 49). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(2) Install snap-ring to hold input/low range gear into front bearing (Fig. 50).

**Fig. 49 Input/Low Range Gear Installation**

- 1 - ANNULUS GEAR  
2 - INPUT/LOW RANGE GEAR

## TRANSFER CASE-NV231 (Continued)

**Fig. 50 Install Snap-Ring**

- 1 - INPUT GEAR  
2 - SNAP-RING

(3) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(4) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(5) Align cavity in seal retainer with fluid return hole in front of case.

**CAUTION:** Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(6) Install bolts to hold retainer to transfer case (Fig. 51). Tighten to 21 N·m (16 ft. lbs.) of torque.

**Fig. 51 Install Front Bearing Retainer**

- 1 - FRONT BEARING RETAINER

**MAINSHAFT**

(1) Lubricate mainshaft splines with recommended transmission fluid.

(2) Slide drive sprocket onto mainshaft.

(3) Slide mode hub onto mainshaft.

(4) Install mode hub retaining ring. Verify that the retaining ring is fully seated in mainshaft groove.

**SHIFT FORKS AND MAINSHAFT**

(1) Install new sector shaft O-ring and bushing (Fig. 52).

**Fig. 52 Sector O-Ring And Bushing Installation**

- 1 - SECTOR BUSHING  
2 - O-RING

(2) Install shift sector in case (Fig. 53). Lubricate sector shaft with transmission fluid before installation.

(3) Install range lever, washer, and nut on sector shaft (Fig. 54). Tighten range lever nut to 27-34 N·m (20-25 ft. lbs.) torque.

(4) Assemble and install range fork and hub (Fig. 55). Be sure hub is properly seated in low range gear and engaged to the input gear.

(5) Align and insert range fork pin in shift sector slot.

(6) Install assembled mainshaft (Fig. 56). Be sure shaft is seated in pilot bearing and input gear.

(7) Install new pads on mode fork if necessary.

(8) Insert mode sleeve in mode fork mode fork. Be sure long side of sleeve is toward long end of shift rail (Fig. 57).

## TRANSFER CASE-NV231 (Continued)

**Fig. 53 Shift Sector Installation**

1 - MODE SLEEVE  
2 - MODE FORK AND RAIL

**Fig. 55 Install Range Fork And Hub Assembly**

1 - RANGE HUB  
2 - RANGE FORK

(9) Install assembled mode fork and sleeve (Fig. 58). Be sure fork rail goes through range fork and into case bore. Also be sure sleeve is aligned and seated on mainshaft hub.

(10) Rotate sector to NEUTRAL position.

(11) Install new O-ring on detent plug (Fig. 59).

(12) Lubricate detent plunger with transmission fluid or light coat of petroleum jelly.

(13) Install detent plunger, spring and plug (Fig. 59).

(14) Verify that plunger is properly engaged in sector.

## TRANSFER CASE-NV231 (Continued)

**Fig. 58 Mode Fork And Sleeve Installation**

- 4 - DRIVE SPROCKET

**Fig. 59 Shift Detent Components**

- 1 - POPPET
- 2 - SPRING
- 3 - SCREW
- 4 - POPPET BORE (IN CASE)

**FRONT OUTPUT SHAFT AND DRIVE CHAIN**

(1) Lubricate front output shaft-sprocket assembly, drive chain, and drive sprocket with transmission fluid.

(2) Assemble drive chain and front output shaft (Fig. 60).

(3) Start chain on mainshaft drive sprocket.

(4) Guide front shaft into bearing and drive sprocket onto mainshaft drive gear (Fig. 60).

(5) Install mode spring on upper end of mode fork shift rail (Fig. 61).

**Fig. 61 Install Mode Fork Spring**

- 1 - MODE SPRING

## TRANSFER CASE-NV231 (Continued)

## OIL PUMP AND REAR CASE

- (1) Install magnet in front case pocket (Fig. 62).
- (2) Assemble oil pickup screen, connecting hose, and tube.
- (3) Install new pickup tube O-ring in oil pump (Fig. 63).

J8921-288

**Fig. 62 Installing Case Magnet**

1 - MAGNET

RR21F27

**Fig. 63 Pickup Tube O-Ring Position**

1 - OIL PUMP  
2 - O-RING

- (4) Insert oil pickup tube in oil pump inlet.
- (5) Position assembled oil pump and pickup tube in rear case. Be sure pickup screen is securely seated in case slot. Also be sure oil pump locating tabs are outside rear case (Fig. 64).

800bdf98

**Fig. 64 Oil Pump And Pickup Tube Installation**

1 - OIL PUMP  
2 - PICKUP TUBE  
3 - PICKUP SCREEN AND CONNECTOR

- (6) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting flange of front case. Work sealer bead around bolt holes.

- (7) Lift rear case and oil pump and carefully position assembly on front case. Be sure case dowels are aligned and that mode fork rail extends through rear case before seating rear case on front case.

- (8) Install case attaching bolts. Alignment bolts at each end of case are only ones requiring washers (Fig. 65).

- (9) Tighten case bolts to 27-34 N·m (20-25 ft. lbs.) torque.

J9321-13

**Fig. 65 Alignment Bolt Location**

1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

## YOKE AND RANGE LEVER

- (1) Install indicator switch in front case. Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

- (2) Install range lever, washer and locknut on sector shaft (Fig. 66). Tighten locknut to 27-34 N·m (20-25 ft. lbs.) torque.

## TRANSFER CASE-NV231 (Continued)

**Fig. 66 Range Lever Installation**

- 1 - RANGE LEVER
- 2 - WASHER
- 3 - LOCKNUT

(3) Install new seal washer on front output shaft (Fig. 68).

(4) Lubricate yoke hub with transmission fluid and install yoke on front shaft.

(5) Install new seal washer on front shaft.

(6) Install yoke and new yoke nut on front output shaft (Fig. 67).

(7) Tighten yoke nut to 122-176 N·m (90-130 ft. lbs.) torque. Use Tool C-3281, or similar tool to hold yoke while tightening yoke nut.

**Fig. 67 Output Shaft Yoke Installation**

- 1 - OUTPUT SHAFT YOKE
- 2 - YOKE NUT

**Fig. 68 Yoke Seal Washer Installation**

- 1 - YOKE SEAL WASHER

**REAR RETAINER**

(1) Apply bead of Mopar® Sealer P/N 82300234, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 inch.

(2) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

(3) Install rear bearing I.D. retaining ring and spacer on output shaft.

(4) Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.

(5) Slide seal onto Seal Protector 6992 (Fig. 69). Slide seal protector and seal onto output shaft.

(6) Slide Installer C-4076-B onto seal protector with the recessed side of the tool toward the seal. Drive seal into rear bearing retainer with Installer C-4076-B and Handle MD-998323 (Fig. 70).

**Fig. 69 Output Shaft Seal and Protector**

- 2 - SPECIAL TOOL MD-998323
- 3 - TRANSFER CASE

**NOTE:** Vehicles built with a 4.0L engine and a manual transmission use a damper weight on the transfer case output shaft. Be sure to identify the transfer case before proceeding.

(7) Install a new output shaft rear slinger with Installer 8408, if the vehicle is not equipped with an output shaft damper.

(8) If the vehicle is equipped with an output shaft damper, install the output shaft damper as follows:

(a) Position the damper weight on the output shaft. Start the damper onto the output shaft chamfer, being careful to keep the weight square to the output shaft. (Fig. 71)

(b) Position the driver portion of Installer 8422 (Fig. 72) onto the damper, making sure the legs of the damper are positioned through the slots of the damper.

(c) Thread the puller screw of Installer 8422 into the output shaft by hand only. Make sure the screw is fully threaded into the output shaft.

(d) Using a wrench to hold the pulling screw stationary (Fig. 73), turn the pulling screw nut until the driver legs contact the rear face of the transfer case rear retainer. When the legs contact the retainer, the damper is properly positioned on the output shaft.

(9) Install boot on output shaft slinger, or output shaft damper, and crimp retaining clamp with tool C-4975-A (Fig. 74).

**Fig. 71 Position Damper on Output Shaft**

## SPEED SENSOR

## REMOVAL

The Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the transfer case extension (left side) (Fig. 75). If equipped with 2WD, this adapter is located on the extension housing of the transmission (left side).

**Fig. 75 VSS Location**

- 1 - SENSOR ELECTRICAL CONNECTOR
- 2 - SLIDE TAB
- 3 - 4WD TRANSFER CASE EXTENSION
- 4 - VEHICLE SPEED SENSOR
- 5 - RELEASE LOCK

- (1) Raise and support vehicle.
- (2) Disconnect electrical connector from sensor by pushing slide tab (Fig. 75). After slide tab has been positioned, push in on secondary release lock (Fig. 75) on side of connector and pull connector from sensor.
- (3) Remove sensor mounting bolt (Fig. 76).
- (4) Remove sensor (pull straight out) from speedometer pinion gear adapter (Fig. 76). Do not remove gear adapter from transmission.

## SPEED SENSOR (Continued)

J9314-188

**Fig. 76 VSS Removal/Installation**

- 1 - ELECTRICAL CONNECTOR
- 2 - SENSOR MOUNTING BOLT
- 3 - O-RING
- 4 - SPEEDOMETER PINION GEAR
- 5 - SPEEDOMETER PINION GEAR ADAPTER
- 6 - O-RING
- 7 - VEHICLE SPEED SENSOR

**INSTALLATION**

(1) Clean inside of speedometer pinion gear adapter before installing speed sensor.

(2) Install sensor into speedometer gear adapter and install mounting bolt. Before tightening bolt, verify speed sensor is fully seated (mounted flush) to speedometer pinion gear adapter.

(3) Tighten sensor mounting bolt to 2.2 N·m (20 in. lbs.) torque.

(4) Connect electrical connector to sensor.
